Approved 2 February 2011

IEEE-SA Standards Board

Approved 4 August 2011

American National Standards Institute

Abstract: This amendment specifies enhancements to the IEEE 802.11 medium access control (MAC) that support wireless local area network (WLAN) interworking with external networks. It enables higher layer functionalities to provide overall end-to-end solutions. The main goals of this amendment are aiding network discovery and selection, enabling information transfer from external networks, enabling emergency services, and interfacing subscription service provider networks (SSPNs) to IEEE 802.11 networks that support interworking with external networks.
Keywords: E911, emergency alert system, emergency services, generic advertisement service, interface, interworking, interworking with external networks, media-independent handover, MIH, network advertisement, network discovery, network selection, QoS mapping, SSP, SSPN, subscriber service provider, wireless LAN

Print: ISBN 978-0-7381-6539-4 STDPD97071

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the soundness of any judgments contained in its standards.

Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents are supplied "**AS IS**."

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation, or every ten years for stabilization. When a document is more than five years old and has not been reaffirmed, or more than ten years old and has not been stabilized, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

In publishing and making this document available, the IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is the IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon his or her independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given IEEE standard.

Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration. A statement, written or oral, that is not processed in accordance with the IEEE-SA Standards Board Operations Manual shall not be considered the official position of IEEE or any of its committees and shall not be considered to be, nor be relied upon as, a formal interpretation of the IEEE. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall make it clear that his or her views should be considered the personal views of that individual rather than the formal position, explanation, or interpretation of the IEEE.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with IEEE. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Recommendations to change the status of a stabilized standard should include a rationale as to why a revision or withdrawal is required. Comments on standards and requests for interpretations should be submitted to the following address:

Secretary, IEEE-SA Standards Board
445 Hoes Lane
Piscataway, NJ 08854
USA

Introduction

This introduction is not part of IEEE Std 802.11u-2011, IEEE Standard for Information technology—Telecommunications and information exchange between systems—Local and metropolitan area networks—Specific requirements—Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications—Amendment 9: Interworking with External Networks.

The interworking with external networks is a key enabler to allow IEEE 802.11 devices to interwork with external networks, as typically found in hotspots or other public networks irrespective of whether the service is subscription-based or free.

The interworking service aids network discovery and selection, which in turn enables information transfer from external networks and enables emergency services. It provides information to the stations (STAs) about the networks prior to association. Interworking will not only help users within home, enterprise, and public access markets, but also assist manufacturers and operators to provide common components and services for IEEE 802.11 customers.

The interworking service addresses medium access control (MAC) layer enhancements that allow higher layer functionality to provide the overall end-to-end interworking solution.

Notice to users

Laws and regulations

Users of these documents should consult all applicable laws and regulations. Compliance with the provisions of this standard does not imply compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

Copyrights

Updating of IEEE documents

Users of IEEE standards should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect. In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit the IEEE Standards Association website at http://ieeexplore.ieee.org/xpl/standards.jsp, or contact the IEEE at the address listed previously.

For more information about the IEEE Standards Association or the IEEE standards development process, visit the IEEE-SA website at http://standards.ieee.org.

Errata

Errata, if any, for this and all other standards can be accessed at the following URL: http://standards.ieee.org/reading/ieee/updates/errata/index.html. Users are encouraged to check this URL for errata periodically.

Interpretations

Current interpretations can be accessed at the following URL: http://standards.ieee.org/reading/ieee/interp/index.html.

Patents

Attention is called to the possibility that implementation of this amendment may require use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence for validity of any patent rights in connection therewith. A patent holder or patent applicant has filed a statement of assurance that it will grant licenses under these rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses. Other Essential Patent Claims may exist for which a statement of assurance has not been received. The IEEE is not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions are reasonable or nondiscriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from the IEEE Standards Association.

IEEE Standard for
Information technology—
Telecommunications and information exchange between systems—
Local and metropolitan area networks—
Specific requirements

Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications

Amendment 9: Interworking with External Networks

(This amendment is based on IEEE Std 802.11™-2007, as amended by IEEE Std 802.11k™-2008, IEEE Std 802.11r™-2008, IEEE Std 802.11y™-2008, IEEE Std 802.11w™-2009, IEEE Std 802.11n™-2009, IEEE Std 802.11p™-2010, IEEE Std 802.11z™-2010, and IEEE Std 802.11v™-2011.)

NOTE—The editing instructions contained in this amendment define how to merge the material contained therein into the existing base standard and its amendments to form the comprehensive standard.

The editing instructions are shown in ***bold italic***. Four editing instructions are used: change, delete, insert, and replace. ***Change*** is used to make corrections in existing text or tables. The editing instruction specifies the location of the change and describes what is being changed by using ~~strikethrough~~ (to remove old material) and underscore (to add new material). ***Delete*** removes existing material. ***Insert*** adds new material without disturbing the existing material. Insertions may require renumbering. If so, renumbering instructions are given in the editing instruction. ***Replace*** is used to make changes in figures or equations by removing the existing figure or equation and replacing it with a new one. Editorial notes will not be carried over into future editions because the changes will be incorporated into the base standard.[1]

[1]Notes in text, tables, and figures are given for information only, and do not contain requirements needed to implement the standard.

1. Overview

1.2 Purpose

Insert the following new list item at end of the dashed list in 1.2:

— Defines functions and procedures aiding network discovery and selection by STAs, information transfer from external networks using QoS mapping, and a general mechanism for the provision of emergency services.

2. Normative references

Insert the following new references in alphanumeric order into Clause 2:

3GPP TS 24.234, 3GPP System to Wireless Local Area Network (WLAN) interworking; WLAN User Equipment (WLAN UE) to network protocols; Stage 3.[2]

IANA EAP Method Type Numbers, http://www.iana.org/assignments/eap-numbers.

IEEE Std 802.21™-2008, IEEE Standard for Local and Metropolitan Area Networks: Media Independent Handover Services, January 2009.[3, 4]

IETF RFC 1035, Domain Names — Implementation and Specification, P. Mockapetris, November 1987.[5]

IETF RFC 3629, UTF-8, a transformation format of ISO 10646, F. Yergeau, November 2003.

IETF RFC 3748, Extensible Authentication Protocol (EAP), B. Aboba, L. Blunk, J. Vollbrecht, J. Carlson, H. Levkowetz, June 2004.

IETF RFC 3986, Uniform Resource Identifier (URI): Generic Syntax, January 2005.

IETF RFC 4282, The Network Access Identifier, December 2005.

IETF RFC 5216, The EAP-TLS Authentication Protocol, D. Simon, B. Aboba, R. Hurst, March 2008.

OASIS Emergency Management Technical Committee, "Emergency Data Exchange Language (EDXL) Distribution Element, v. 1.0." OASIS Standard EDXL-DE v1.0, May 2006.

3. Definitions

Insert the following new definitions in alphabetical order into Clause 3, renumbering as necessary:

3.267 Access Network Query Protocol (ANQP): The query protocol for access network information retrieval transported by generic advertisement service (GAS) Public Action frames.

[2]3GPP documents are available from the 3rd Generation Partnership Project Web site (http://www.3gpp.org).

[3]IEEE publications are available from the Institute of Electrical and Electronics Engineers, 445 Hoes Lane, Piscataway, NJ 08854, USA (http://standards.ieee.org/).

[4]The IEEE standards or products referred to in this clause are trademarks of the Institute of Electrical and Electronics Engineers, Inc.

[5]Internet RFCs are available from the Internet Engineering Task Force at http://www.ietf.org/.

3.268 advertisement protocol: Access Network Query Protocol (ANQP) and higher layer protocols defined external to IEEE Std 802.11 that are used for network and service discovery.

3.269 advertisement server: A logical server that provides the information repository for a specific advertisement protocol. The location of the physical server that instantiates the advertisement server is outside the scope of this specification.

3.270 authorization: The act of determining if a particular right, such as access to some resource, can be granted to an authenticated entity.

NOTE—See RFC 2903 [B44].[6]

3.271 emergency alert system (EAS): A U.S. national public warning system.

3.272 emergency services association: A robust security network association (RSNA) between an access point (AP) and a non-AP station (STA) without security credentials; the non-AP STA is granted access to emergency services using unprotected frames via this association.

3.273 extended service set (ESS) link: In the context of an IEEE 802.11 medium access control (MAC) entity, a connection path through the wireless medium between a non-access point (non-AP) station (STA) and one of the APs that is a member of the ESS.

3.274 generic advertisement service (GAS): An IEEE 802.11 service that provides over-the-air transportation for frames of higher layer advertisements between stations (STAs) or between an advertisement server and a non-access point (non-AP) STA. The protocol(s) used to relay frames between an AP, portal, and advertisement server is outside the scope of this standard. GAS supports higher layer protocols that employ a query/response mechanism.

3.275 infrastructure authorization information: The information that specifies the access rights of the user of a non-access point (non-AP) station (STA) in an IEEE 802.11 infrastructure. This information may include the rules for routing the user traffic, a set of permissions about services that a user is allowed to access, quality of service (QoS) configuration information, or the accounting policy to be applied by the IEEE 802.11 infrastructure.

3.276 homogenous extended service set (ESS): A collection of basic service sets (BSSs), within the same extended service set (ESS), in which every subscription service provider network (SSPN) or other external network reachable at one BSS is reachable at all of them.

3.277 interworking service: A service that supports use of an IEEE 802.11 network with non-IEEE 802.11 networks. Functions of the interworking service assist non-access point (non-AP) stations (STAs) in discovering and selecting IEEE 802.11 networks, in using appropriate quality of service (QoS) settings for transmissions, in accessing emergency services, and in connecting to subscription service providers (SSPs).

3.278 multi-level precedence and preemption (MLPP): A framework used with admission control for the treatment of traffic streams based on precedence, which supports the preemption of an active traffic stream by a higher precedence traffic stream when resources are limited. Preemption is the act of forcibly removing a traffic stream in progress in order to free up resources for another higher precedence traffic stream.

3.279 network access identifier (NAI): The user identity submitted by the Supplicant during IEEE 802.1X authentication.

NOTE—See RFC 4282.[7]

[6]The numbers in brackets correspond to the numbers of the bibliography in Annex P.

[7]Information on references can be found in Clause 2.

3.280 public safety answering point (PSAP): A physical location where emergency calls are received and routed to the proper emergency services such as police and ambulance.

NOTE—See NENA 08-002 [B51].

3.281 roaming consortium: A group of subscription service providers (SSPs) having inter-SSP roaming agreements.

3.282 subscription service provider (SSP): An organization (operator) offering connection to network services, perhaps for a fee.

3.283 subscription service provider network (SSPN): The network controlled by a subscription service provider (SSP). The network maintains user subscription information.

3.284 subscription service provider (SSP) roaming: The act when a station (STA) uses an SSP's IEEE 802.11 infrastructure, with which the terminal has no direct agreement, based on a subscription and formal agreement with the STA's own SSP.

4. Abbreviations and acronyms

Insert the following new abbreviations and acronyms into Clause 4 in alphabetical order:

3GPP™	3rd Generation Partnership Project
802.x LAN	IEEE 802®-based local area networks such as IEEE 802.3 and IEEE 802.11
AAA	authentication, authorization, and accounting
ANQP	Access Network Query Protocol
ASRA	additional step required for access
DN	destination network
EAS	emergency alert system
EBR	expedited bandwidth request
ESR	emergency services reachable
GAS	generic advertisement service
GPRS	general packet radio service
HESSID	homogenous extended service set identifier
MIH	media-independent handover
MLPP	multi-level precedence and preemption
MSGCF	MAC state generic convergence function
NAI	network access identifier
OI	organization identifier
PHB	per-hop behavior
PSAP	public safety answering point
SSP	subscription service provider
SSPN	subscription service provider network
UESA	unauthenticated emergency service accessible
URL	uniform resource locator
URI	uniform resource identifier
VLAN	virtual local area network

5. General description

5.2 Components of the IEEE 802.11 architecture

Insert the following new subclause (5.2.13) after 5.2.12.22:

5.2.13 Subscription service provider network (SSPN) interface

An AP can interact with external networks using a SSPN interface for the purpose of authenticating users and provisioning services, as shown in Figure 5-6a. The exchange of authentication and provisioning information between the SSPN and the AP passes transparently through the Portal. The protocol used to exchange this information is outside the scope of this standard. The logical SSPN interface provides the means for an AP to consult an SSPN for authenticating and authorizing a specific non-AP STA and to report statistics and status information to the SSPN. Authentication and provisioning information for non-AP STAs received from the SSPN are stored in the AP management information base (MIB) and are used to limit layer-2 services provided to that non-AP STA. Detailed interactions describing the SSPN interface are provided in 11.23.5.

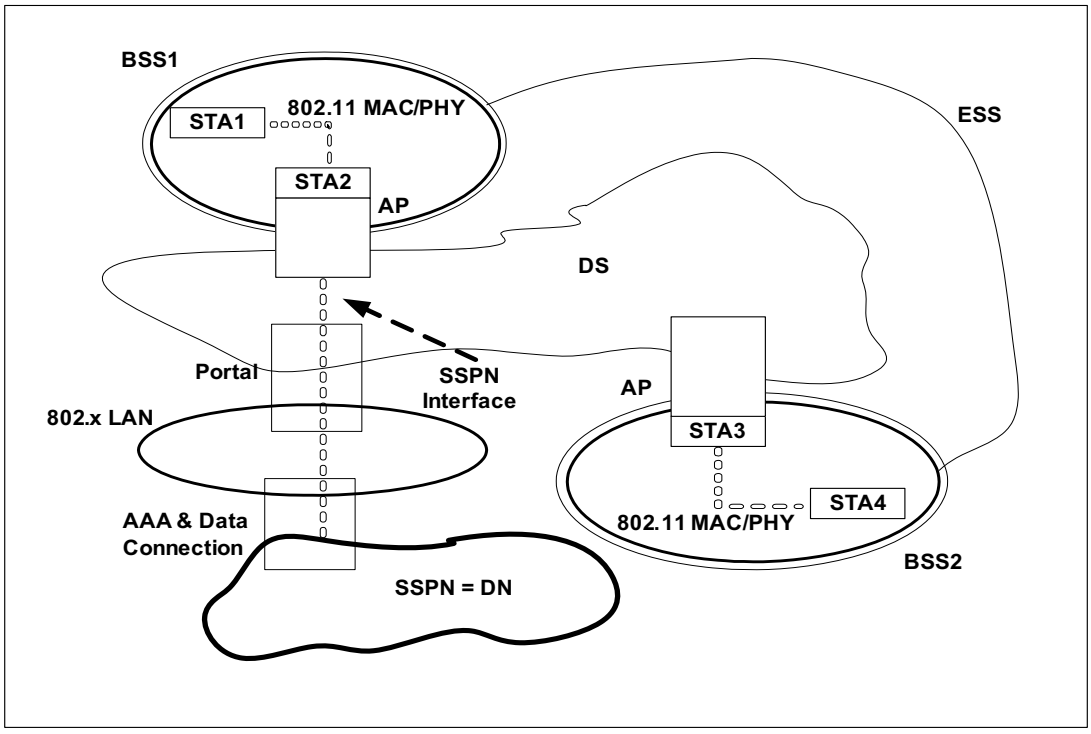

Figure 5-6a—SSPN interface service architecture

The SSPN interface provides the non-AP STA access to the services provisioned in the SSPN via the currently associated BSS. SSPN access may involve virtual local area network (VLAN) mapping or tunnel establishment that are transparent to the non-AP STA and outside the scope of this standard. The SSPN interface also allows the non-AP STA to access services in destination networks (DNs) other than the SSPN. An example of a DN other than SSPN is the provision of Internet access via the IEEE 802 LAN, or an intermediary network that connects the IEEE 802.11 infrastructure and the SSPN.

NOTE—The SSPN Interface Service is not supported in an IBSS.

5.4 Overview of the services

Insert the following new subclause (5.4.8) after 5.4.7:

5.4.8 Interworking with external networks

The interworking service allows non-AP STAs to access services provided by an external network according to the subscription or other characteristics of that external network. An IEEE 802.11 non-AP STA may have a subscription relationship with an external network, e.g., with an SSPN.

An overview of the interworking functions addressed in this standard is provided below:

- Network discovery and selection
  - Discovery of suitable networks through the advertisement of access network type, roaming consortium and venue information, via management frames
  - Selection of a suitable IEEE 802.11 infrastructure using advertisement services (e.g., Access Network Query Protocol (ANQP) or an IEEE 802.21 Information Server) in the BSS or in an external network reachable via the BSS.
  - Selection of an SSPN or external network with its corresponding IEEE 802.11 infrastructure
- Emergency services
  - Emergency Call and Network Alert support at the link level
- QoS Map distribution
- SSPN interface service between the AP and the SSPN

The generic advertisement service (GAS), described in 5.9, can be used by a STA to provide support for the network selection process and as a conduit for communication by a non-AP STA with other information resources in a network before joining the wireless LAN.

The interworking service supports emergency services by providing methods for users to access emergency services via the IEEE 802.11 infrastructure, advertising that emergency services are supported (see 11.23.6) and identifying that a traffic stream is used for emergency services.

The interworking service provides QoS mapping for SSPNs and other external networks. Since each SSPN or other external network may have its own layer-3 end-to-end packet marking practice (e.g., DSCP usage conventions), a means to re-map the layer-3 service levels to a common over-the-air service level is necessary. The QoS Map service provides STAs a mapping of network-layer QoS packet marking to over-the-air QoS frame marking (i.e., user priority).

The SSPN Interface service supports service provisioning and transfer of user permissions from the SSPN to the AP. The method and protocol by which these permissions are transferred from the SSPN are outside the scope of this standard.

5.7 Reference model

Insert the following new subclause heading 5.7.1 immediately after the subclause heading 5.7 and before the existing text:

5.7.1 General

Change the first paragraph of 5.7.1 as follows:

This standard presents the architectural view, emphasizing the separation of the system into two major parts: the MAC of the data link layer (DLL) and the PHY. These layers are intended to correspond closely to the lowest layers of the ISO/IEC basic reference model of Open Systems Interconnection (OSI) (ISO/IEC 7498-1: 1994). The MAC state generic convergence function (MSGCF) provides services to higher layer protocols based on MAC state machines and interactions between the layers. The layers and sublayers described in this standard are shown in Figure 5-10.

Insert the following new subclause (5.7.2) after 5.7.1:

5.7.2 Interworking reference model

Interworking functions may require correlating information from multiple management entities. It is the function of the MSGCF to correlate information for higher layer entities. The MSGCF observes the interactions between the MLME and SME, and between the PLME and SME. After correlation of lower-layer MLME and PLME events, the MSGCF may synthesize indications to higher layer entities.

Figure 5-10a shows an entity, the MSGCF, defined in Clause 11B, that has access to all management information through exposure to the MAC and PHY Sublayer Management Entities, and provides management information to higher level entities, such as Mobility Managers, supporting heterogeneous medium mobility.

An example of how the MSGCF interfaces to these higher layer entities, is provided by the media-independent handover (MIH) interface, as defined in IEEE 802.21-2008.

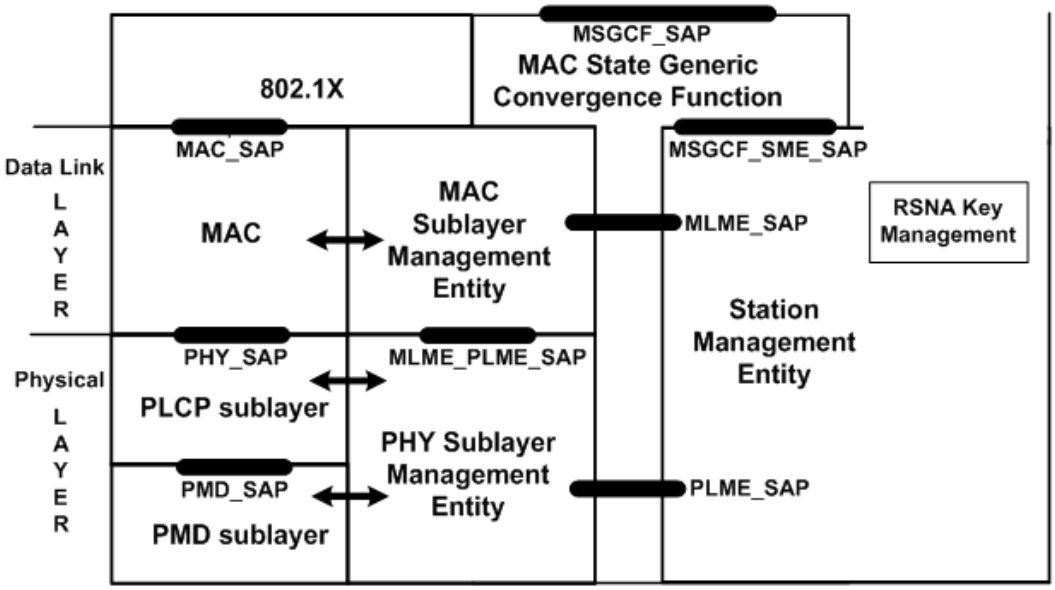

Figure 5-10a—Interworking reference model

The MSGCF is designed to provide the status of the connection of a non-AP STA to a set of BSSs comprising a single ESS. Figure 5-10b illustrates the concept of an ESS Link. This reflects the state of a connection to an ESS independent of any particular access point. In Figure 5-10b, STA3 is associated with either AP1 or AP2. The state of the ESS Link is up when STA3 is associated with any of the APs comprising an ESS.

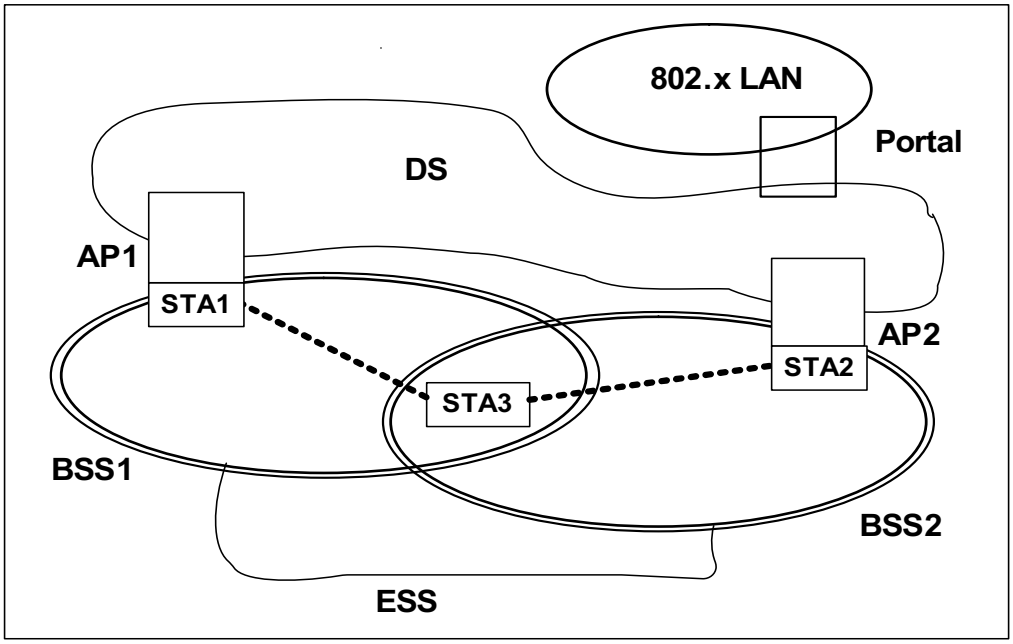

Figure 5-10b—ESS link illustration

Insert the following new subclause (5.9) after 5.8:

5.9 Generic advertisement service (GAS)

GAS provides functionality that enables STAs to discover the availability of information related to desired network services, e.g., information about services such as provided in an IBSS, local access services, available subscription service providers (SSPs) and/or SSPNs or other external networks. GAS uses a generic container to advertise network services' information over an IEEE 802.11 network. Public Action frames are used to transport this information.

While the specification of network services information is outside the scope of this standard, in an Infrastructure BSS there is a need for STAs to query for information on network services provided by SSPNs or other external networks beyond an AP, before they associate to the wireless LAN. The exchange of information may also be performed after associating to the BSS.

In an IBSS, GAS functionality enables a STA to access the availability and information related to desired services provided by other STAs in the IBSS. Exchange of information using GAS may be performed either prior to joining an IBSS or after joining the IBSS.

There are a number of reasons why providing information to a STA in a pre-associated state is beneficial:

— It supports more informed decision making about an IEEE 802.11 infrastructure with which to associate. This is generally more efficient than requiring a non-AP STA to associate with an AP before discovering the information and then deciding whether or not to stay associated.

— It is possible for the non-AP STA to query multiple networks in parallel.

— The non-AP STA can discover information about APs that are not part of the same administrative group as the AP with which it is associated, supporting the selection of an AP belonging to a different IEEE 802.11 infrastructure that has an appropriate SSP roaming agreement in place.

6. MAC service definition

6.1 Overview of MAC services

6.1.5 MAC data service architecture

Change the first two paragraphs of 6.1.5 as follows:

The MAC data plane architecture (i.e., processes that involve transport of all or part of an MSDU) is shown in Figure 6-1. During transmission, an MSDU goes through some or all of the following processes: MSDU rate limiting, A-MSDU aggregation, frame delivery deferral during power save mode, sequence number assignment, fragmentation, encryption, integrity protection, and frame formatting and A-MPDU aggregation. IEEE Std 802.1X-2004 may block the MSDU at the Controlled Port. At some point, the data frames that contain all or part of the MSDU are queued per AC/TS. This queuing may be at any of the three points indicated in Figure 6-1.

During reception, a received data frame goes through processes of possible A-MPDU de-aggregation, MPDU header and cyclic redundancy code (CRC) validation, duplicate removal, possible reordering if the Block Ack mechanism is used, decryption, defragmentation, integrity checking, and replay detection. After replay detection (or defragmentation if security is used), ~~and~~ possible A-MSDU de-aggregation and possible MSDU rate limiting, the one or more MSDUs ~~is~~ are delivered to the MAC_SAP or to the DS. The IEEE 802.1X Controlled/Uncontrolled Ports discard ~~the~~ any received MSDU if the Controlled Port is not enabled and if the MSDU does not represent an IEEE 802.1X frame. TKIP and CCMP MPDU frame order enforcement occurs after decryption, but prior to MSDU defragmentation; therefore, defragmentation will fail if MPDUs arrive out of order.

Replace Figure 6-1—MAC data plane architecture with the following figure:

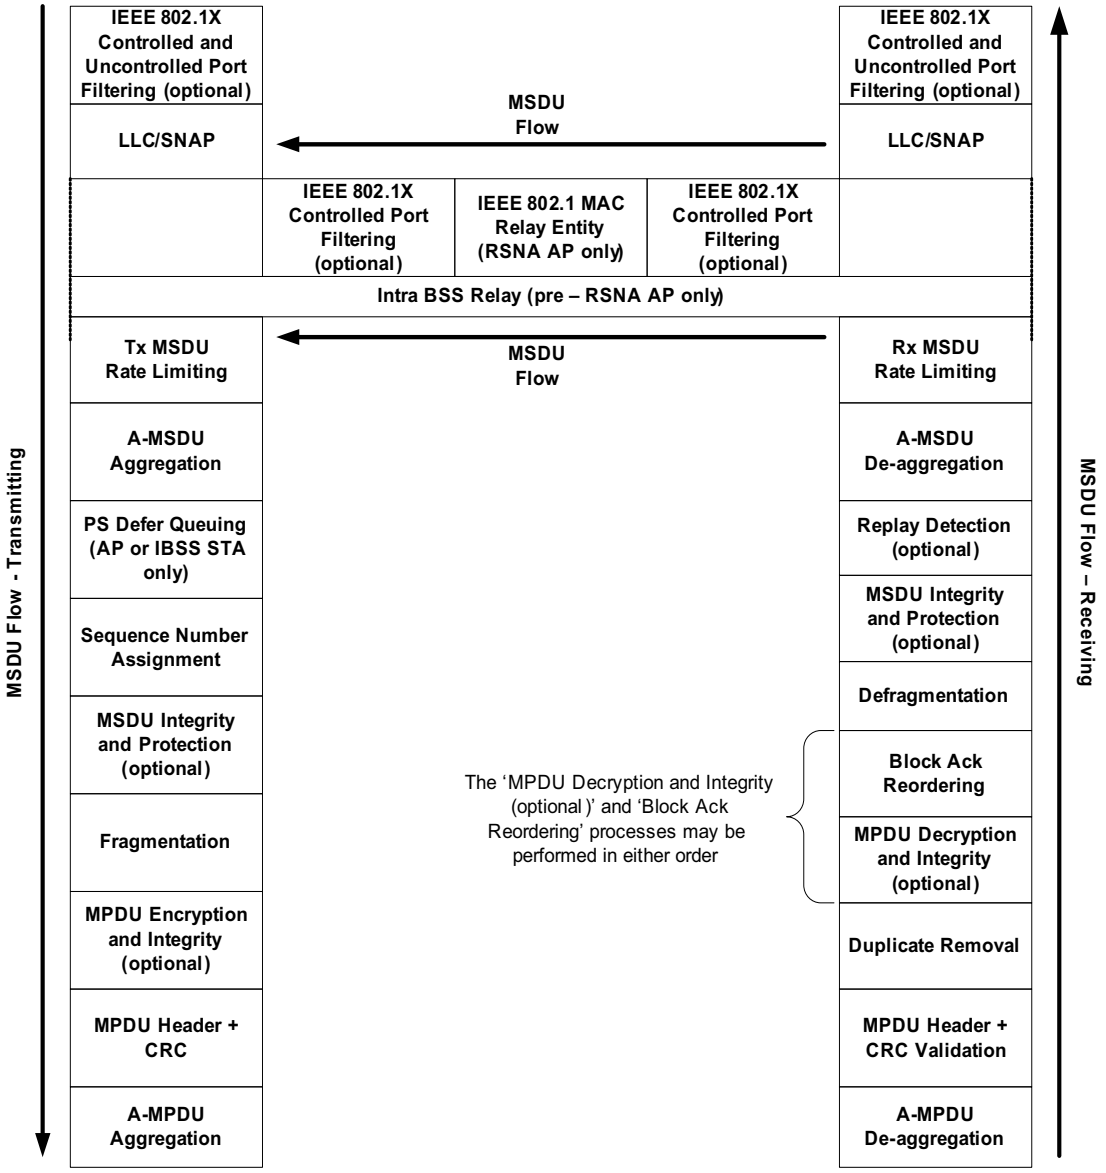

Figure 6-1—MAC data plane architecture

6.2 Detailed service specification

6.2.1 MAC data services

6.2.1.1 MA-UNITDATA.request

6.2.1.1.4 Effect of receipt

Insert the following text after the first paragraph of 6.2.1.1.4:

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address and a priority of Contention or Contention-Free, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted. The specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffort-MSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffort-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address for which the priority is an integer in the range of 0 to 7, inclusive, then the AP's MAC sublayer shall derive the access category from the priority using the mapping in Table 9-1. The AP's MAC sublayer shall retrieve the MIB variables listed below from the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted and perform the following operations:

— If the access category is AC_VO, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDU-Count shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_VI, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCount shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDU-Count shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BE, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and

dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BK, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address whose priority is an integer in the range of 8 to 15, inclusive, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRate; the specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMM-MSDUCount shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMM-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

6.2.1.2 MA-UNITDATA.indication

6.2.1.2.4 Effect of receipt

Insert the following text after the first paragraph of 6.2.1.2.4:

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of a frame of type data having a broadcast/multicast DA, the AP's MAC sublayer shall discard the frame if dot11NonAPStationAuthSourceMulticast is false in the dot11InterworkingEntry identified by the source MAC address of the received frame. If dot11NonAPStationAuthSourceMulticast is true, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxSourceMulticastRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationMulticast-MSDUCount shall be incremented by 1 and dot11NonAPStationMulticastOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedMulticast-MSDUCount. shall be incremented by 1 and dot11NonAPStationDroppedMulticastOctetCount. shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame of type data and a priority of Contention or ContentionFree, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffort-MSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffort-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame of type data, for which the priority is an integer in the range of 0 to 7, inclusive, then the AP's MAC sublayer shall derive the access category from the priority using the mapping in Table 9-1. The AP's MAC sublayer shall retrieve the MIB variables from the dot11InterworkingEntry identified by the source MAC address of the received frame and perform the following operations:

— If the access category is AC_VO, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDU-Count shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_VI, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCount shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDU-Count shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BE, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BK, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame of type data for which the priority is an integer in the range of 8 to 15, inclusive, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRate; the specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMM-MSDUCount shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMM-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

6.2.1.3 MA-UNITDATA.confirm

6.2.1.3.1 Function

Insert the following items into the lettered list in 6.2.1.3.1 after item i):

j) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVoiceRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

k) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVideoRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

l) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

m) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationBackgroundRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

n) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11nonAPStationAuxMaxHCCAHEMMrate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

7. Frame formats

7.1 MAC frame formats

7.2 Format of individual frame types

7.2.3 Management frames

7.2.3.1 Beacon frame format

Change order 31 information field and insert order 45 through 48 information fields into Table 7-8 as follows (note that the entire table is not shown here):

Table 7-8—Beacon frame body

Order	Information	Notes
31	Multiple BSSID	One or more Multiple BSSID elements are present if dot11RRMMeasurementPilotCapability is a value between 2 and 7 and the AP is a member of a Multiple BSSID Set (see 11.10.11) with two or more members, or if dot11MgmtOptionMultiBSSIDActivated is true~~.~~, or if dot11InterworkingServiceActivated is true and the AP is a member of a Multiple BSSID Set with two or more members and at least one dot11GASAdvertisementID MIB attribute exists.
45	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
46	Advertisement Protocol	Advertisement Protocol element is present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID MIB attribute exists.
47	Roaming Consortium	The Roaming Consortium element is present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry.
48	Emergency Alert Identifier	One or more Emergency Alert Identifier elements are present if dot11EASActivated is true and there are one or more EAS message(s) active in the network.

7.2.3.4 Association Request frame format

Insert the order 18 information field into Table 7-10 (note that the entire table is not shown here):

Table 7-10—Association Request frame body

Order	Information	Notes
18	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true and the non-AP STA is requesting unauthenticated access to emergency services (see 11.3.2).

7.2.3.5 Association Response frame format

Insert the order 21 information field into Table 7-11 (note that the entire table is not shown here):

Table 7-11—Association Response frame body

Order	Information	Notes
21	QoS Map	QoS Map is present if dot11QosMapActivated is true and the QoS Map field in the Extended Capabilities element of the corresponding Association Request frame is 1.

7.2.3.6 Reassociation Request frame format

Insert the order 23 information field into Table 7-12 (note that the entire table is not shown here):

Table 7-12—Reassociation Request frame body

Order	Information	Notes
23	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true and the non-AP STA is requesting unauthenticated access to emergency services (see 11.3.2).

7.2.3.7 Reassociation Response frame format

Insert the order 25 information field into Table 7-13 (note that the entire table is not shown here):

Table 7-13—Reassociation Response frame body

Order	Information	Notes
25	QoS Map	QoS Map is present if dot11QosMapActivated is true and the QoS Map field in the Extended Capabilities element of the corresponding Reassociation Request frame is 1.

7.2.3.8 Probe Request frame format

Insert order 12 information field into Table 7-14 (note that the entire table is not shown here):

Table 7-14—Probe Request frame body

Order	Information	Notes
12	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.

7.2.3.9 Probe Response frame format

Change order 24 information field and insert order 44 through 47 information fields into Table 7-15 as follows (note that the entire table is not shown here):

Table 7-15—Probe Response frame body

Order	Information	Notes
24	Multiple BSSID	One or more Multiple BSSID elements are present if dot11RRMMeasurementPilotCapability is a value between 2 and 7 and the AP is a member of a Multiple BSSID Set (see 11.10.11) with two or more members, or if dot11MgmtOptionMultiBSSIDActivated is true~~.~~, or if dot11InterworkingServiceActivated is true and the AP is a member of a Multiple BSSID Set with two or more members and at least one dot11GASAdvertisementID MIB attribute exists.
44	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
45	Advertisement Protocol	Advertisement Protocol element is present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID MIB attribute exists.
46	Roaming Consortium	The Roaming Consortium element is present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry.
47	Emergency Alert Identifier	One or more Emergency Alert Identifier elements are present if dot11EASActivated is true and there are one or more EAS message(s) active in the network.

7.3 Management frame body components

7.3.1 Fields that are not information elements

7.3.1.7 Reason Code field

Insert reason codes 27 through 30 and 46 and 47 into Table 7-22 (note that the entire table is not shown here):

Table 7-22—Reason codes

Reason code	Meaning
27	Disassociated because session terminated by SSP request
28	Disassociated because of lack of SSP roaming agreement
29	Requested service rejected because of SSP cipher suite or AKM requirement
30	Requested service not authorized in this location
46	Disassociated because authorized access limit reached
47	Disassociated due to external service requirements

7.3.1.9 Status Code field

Insert status codes 59 through 65 and 67, 68, and 79 into Table 7-23 as follows (note the entire table is not shown here):

Table 7-23—Status codes

Status code	Meaning
59	GAS Advertisement Protocol not supported
60	No outstanding GAS request
61	GAS Response not received from the Advertisement Server
62	STA timed out waiting for GAS Query Response
63	GAS Response is larger than query response length limit
64	Request refused because home network does not support request
65	Advertisement Server in the network is not currently reachable
67	Request refused due to permissions received via SSPN interface
68	Request refused because AP does not support unauthenticated access
79	Transmission failure

Insert the following new subclauses (7.3.1.33 and 7.3.1.34) after 7.3.1.32:

7.3.1.33 GAS Query Response Fragment ID field

A GAS Query Fragment Response ID field is used by the STA to indicate when a GAS Query Response spans multiple MMPDUs. STAs responding to GAS request use this field to inform the requesting STA of the GAS fragment number of the transmitted frames as well as identifying the last GAS fragment of the Query Response. Requesting STAs use this field to determine if any fragments of the Query Response are missing. The maximum value permitted in the GAS Query Response Fragment ID is 127. The More GAS Fragments field is set to 1 in GAS Query Response fragments of GAS Comeback Response frames that have another GAS fragment of the current query response to follow; otherwise, it is set to 0. The format of GAS Query Response Fragment ID is shown in Figure 7-36r.

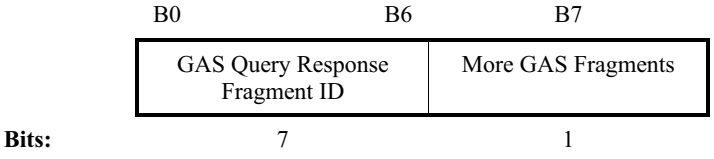

Figure 7-36r—GAS Query Response Fragment ID field

7.3.1.34 Venue Info field

The Venue Info field is a 2-octet field. It contains Venue Group and Venue Type subfields. The format of Venue Info subfield is shown in Figure 7-36s.

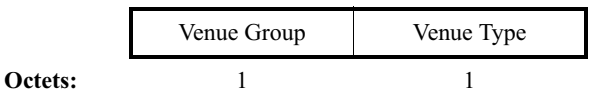

Figure 7-36s—Venue Info field format

The Venue Group and Venue Type subfields are both one octet values selected from Table 7-25m and Table 7-25n respectively. The entries in Table 7-25m and Table 7-25n are drawn from the International Building Code's Use and Occupancy Classifications [B48].

Table 7-25m—Venue Group codes and descriptions

Venue Group code	Venue Group description
0	Unspecified
1	Assembly
2	Business
3	Educational
4	Factory and Industrial
5	Institutional
6	Mercantile
7	Residential
8	Storage
9	Utility and Miscellaneous
10	Vehicular
11	Outdoor
12 – 255	Reserved

Table 7-25n—Venue Type assignments

Venue Group code	Venue Type code	Venue description
0	0	Unspecified
0	1 – 255	Reserved
1	0	Unspecified Assembly
1	1	Arena
1	2	Stadium
1	3	Passenger Terminal (e.g., airport, bus, ferry, train station)
1	4	Amphitheater
1	5	Amusement Park
1	6	Place of Worship
1	7	Convention Center
1	8	Library
1	9	Museum
1	10	Restaurant
1	11	Theater
1	12	Bar
1	13	Coffee Shop

Table 7-25n—Venue Type assignments *(continued)*

Venue Group code	Venue Type code	Venue description
1	14	Zoo or Aquarium
1	15	Emergency Coordination Center
1	16 – 255	Reserved
2	0	Unspecified Business
2	1	Doctor or Dentist office
2	2	Bank
2	3	Fire Station
2	4	Police Station
2	6	Post Office
2	7	Professional Office
2	8	Research and Development Facility
2	9	Attorney Office
2	10 – 255	Reserved
3	0	Unspecified Educational
3	1	School, Primary
3	2	School, Secondary
3	3	University or College
3	4 – 255	Reserved
4	0	Unspecified Factory and Industrial
4	1	Factory
4	2 – 255	Reserved
5	0	Unspecified Institutional
5	1	Hospital
5	2	Long-Term Care Facility (e.g., Nursing home, Hospice, etc.)
5	3	Alcohol and Drug Re-habilitation Center
5	4	Group Home
5	5	Prison or Jail
5	6 – 255	Reserved
6	0	Unspecified Mercantile
6	1	Retail Store
6	2	Grocery Market
6	3	Automotive Service Station
6	4	Shopping Mall
6	5	Gas Station
6	6 – 255	Reserved
7	0	Unspecified Residential
7	1	Private Residence

Table 7-25n—Venue Type assignments *(continued)*

Venue Group code	Venue Type code	Venue description
7	2	Hotel or Motel
7	3	Dormitory
7	4	Boarding House
7	5 – 255	Reserved
8	0	Unspecified Storage
8	1 – 255	Reserved
9	0	Unspecified Utility and Miscellaneous
9	1 – 255	Reserved
10	0	Unspecified Vehicular
10	1	Automobile or Truck
10	2	Airplane
10	3	Bus
10	4	Ferry
10	5	Ship or Boat
10	6	Train
10	7	Motor Bike
10	8 – 255	Reserved
11	0	Unspecified Outdoor
11	1	Muni-mesh Network
11	2	City Park
11	3	Rest Area
11	4	Traffic Control
11	5	Bus Stop
11	6	Kiosk
11	7 – 255	Reserved

7.3.2 Information elements

Insert element identifiers (IDs) 107 through 112 and change the Reserved row in Table 7-26 as follows (note the entire table is not shown here):

Table 7-26—Element IDs

Information element	Element ID	Length (in octets)	Extensible
Interworking (see 7.3.2.92)	107	3, 5, 9, 11	
Advertisement Protocol (see 7.3.2.93)	108	variable	
Expedited Bandwidth Request (see 7.3.2.94)	109	3	
QoS Map Set (see 7.3.2.95)	110	18 to 60	Yes
Roaming Consortium (see 7.3.2.96)	111	variable	Yes
Emergency Alert Identifier (see 7.3.2.97)	112	10	
Reserved	113 ~~107~~ –140 and 143 – 220		

7.3.2.27 Extended Capabilities information element

Insert the rows for Bit 31 through Bit 36 into Table 7-35a as follows (note the entire table is not shown here):

Table 7-35a—Capabilities field

Bit(s)	Information	Notes
31	Interworking	When dot11InterworkingServiceActivated is true, the Interworking field is set to 1 to indicate the STA supports interworking service as described in 11.23. When dot11InterworkingServiceActivated is false, the Interworking field is set to 0 to indicate the STA does not support this capability.
32	QoS Map	When dot11QosMapActivated is true, the QoS Map field is set to 1 to indicate the STA supports QoS Map service as described in 11.23.9. When dot11QosMapActivated is false, the QoS Map field is set to 0 to indicate the STA does not support this capability.
33	EBR	When dot11EBRActivated is true, the EBR field is set to 1 to indicate the STA supports EBR operation as described in 11.4. When dot11EBRActivated is false, the EBR field is set to 0 to indicate the STA does not support this capability.
34	SSPN Interface	When dot11SSPNInterfaceActivated is true, the SSPN Interface field is set to 1 to indicate the AP supports SSPN Interface service as described in 11.23.5. When dot11SSPNInterfaceActivated is false, the SSPN Interface is set to 0 to indicate the AP does not support this capability. Non-AP STAs set this field to 0.
35	Reserved	This bit is reserved and is set to 0 on transmission and ignored on reception.
36	MSGCF Capability	When dot11MSGCFActivated is true, the MSGCF Capability field is set to 1 to indicate the non-AP STA supports the MSGCF in 11B. When dot11MSGCFActivated is false, the MSGCF Capability is set to 0 to indicate the non-AP STA does not support this capability. APs set this field to 0.

Insert the following new subclauses (7.3.2.92 through 7.3.2.97) after 7.3.2.91:

7.3.2.92 Interworking information element

The Interworking information element contains information about the interworking service capabilities of a STA as shown in Figure 7-95o118.

	Element ID	Length	Access Network Options	Venue Info (optional)	HESSID (optional)
Octets:	1	1	1	0 or 2	0 or 6

Figure 7-95o118—Interworking element format

The Length is a one-octet field whose value is 1 plus the sum of the lengths of each optional field present in the element.

The format of Access Network Options field is shown in Figure 7-95o119.

Bits:	B0 – B3	B4	B5	B6	B7
	Access Network Type	Internet	ASRA	ESR	UESA

Figure 7-95o119—Access Network Options format

A non-AP STA sets Internet, ASRA, ESR, and UESA fields to 0 when including the Interworking element in the Probe Request frame. A non-AP STA sets the Internet, ASRA and ESR bits to 0 when including the Interworking element in (Re)association Request frames. In (Re)association Request frames, a non-AP STA sets the UESA bit according to the procedures in 11.3.2. The Access Network Types are shown in Table 7-43bh. The Access Network Type field is set by the AP to advertise its Access Network Type to non-AP STAs. A non-AP STA uses this field to indicate the desired Access Network Type in an active scan. See X.1 for informative text on usage of fields contained within the Interworking element.

Bit 4 is the Internet field. The AP sets this field to 1 if the network provides connectivity to the Internet; otherwise it is set to 0 indicating that it is unspecified whether the network provides connectivity to the Internet.

Bit 5 is the Additional Step Required for Access (ASRA) field. It is set to 1 by the AP to indicate that the network requires a further step for access. It is set to 0 whenever dot11RSNAEnabled is true. For more information, refer to Network Authentication Type Information in 7.3.4.5.

Bit 6 is the ESR (emergency services reachable) field. It is set to 1 by the AP to indicate that emergency services are reachable through the AP; otherwise it is set to 0 indicating that it is unspecified whether emergency services are reachable, see 11.23.6.

Bit 7 is the UESA (unauthenticated emergency service accessible) field. When the AP sets it to 0, this field indicates that no unauthenticated emergency services are reachable through this AP. When set to 1, this field indicates that higher layer unauthenticated emergency services are reachable through this AP. A STA uses the Interworking information element with the UESA bit set to 1 to gain unauthenticated access to a BSS to access emergency services. See 11.3.2.

Table 7-43bh—Access network type

Access network type	Meaning	Description
0	Private network	Non-authorized users are not permitted on this network. Examples of this access network type are home networks and enterprise networks, which may employ user accounts. Private networks do not necessarily employ encryption.
1	Private network with guest access	Private network but guest accounts are available. Example of this access network type is enterprise network offering access to guest users.
2	Chargeable public network	The network is accessible to anyone, however, access to the network requires payment. Further information on types of charges may be available through other methods (e.g., IEEE 802.21, http/https redirect or DNS redirection). Examples of this access network type is a hotspot in a coffee shop offering internet access on a subscription basis or a hotel offering in-room internet access service for a fee.
3	Free public network	The network is accessible to anyone and no charges apply for the network use. An example of this access network type is an airport hotspot or municipal network providing free service.
4	Personal device network	A network of personal devices. An example of this type of network is a camera attaching to a printer, thereby forming a network for the purpose of printing pictures.
5	Emergency services only network	A network dedicated and limited to accessing emergency services.
6 to 13	Reserved	Reserved
14	Test or experimental	The network is used for test or experimental purposes only.
15	Wildcard	Wildcard access network type

The Venue Info field is defined in 7.3.1.34.

The HESSID field, which is the identifier for a homogeneous ESS, specifies the value of HESSID, see 11.23.2. A STA uses this field to indicate the desired HESSID in an active scan per 11.1.3. The HESSID field for an AP is set to the value of dot11HESSID.

7.3.2.93 Advertisement Protocol element

The Advertisement Protocol element contains information that identifies a particular advertisement protocol and its corresponding Advertisement Control. The Advertisement Protocol element format is shown in Figure 7-95o120.

	Element ID	Length	Advertisement Protocol Tuple # 1	Advertisement Protocol Tuple # 2 (optional)	...	Advertisement Protocol Tuple # n (optional)
Octets:	1	1	variable	variable		variable

Figure 7-95o120—Advertisement Protocol element format

The Length is a one-octet field whose value is equal to the sum of the lengths of the Advertisement Protocol Tuple fields.

The format of Advertisement Protocol Tuple is shown in Figure 7-95o121.

	Query Response Info	Advertisement Protocol ID
Octets:	1	variable

Figure 7-95o121—Advertisement Protocol Tuple format

The format of Query Response Info field is shown in Figure 7-95o122.

Bits:	B0 – B6	B7
	Query Response Length Limit	PAME-BI

Figure 7-95o122—Query Response Info format

The Query Response Info field is defined as follows:

— The Query Response Length Limit indicates the maximum number of octets a STA will transmit in the Query Response field contained within one or more GAS Comeback Response frames. The Query Response Length Limit may be set to a value larger than the maximum MMPDU size in which case the Query Response spans multiple MMPDUs. The Query Response Length Limit is encoded as an integer number of 256 octet units. A value of zero is not permitted. A value of 0x7F means the maximum limit enforced is determined by the maximum allowable number of fragments in the GAS Query Response Fragment ID (see 7.3.1.33). The requesting STA sets the Query Response Length Limit to zero on transmission and the responding STA ignores it upon reception.

— Bit 7, the Pre-Association Message Exchange BSSID Independent (PAME-BI) bit, is used by an AP to indicate whether the Advertisement Server, which is the non-AP STA's peer for this Advertisement Protocol, will return a Query Response that is independent of the BSSID used for the GAS frame exchange. This bit is set to 1 to indicate the Query Response is independent of the BSSID; it is set to zero to indicate that the Query Response may be dependent on the BSSID. See 11.23.3.1 for further information. Bit 7 is reserved for non-AP STAs.

The Advertisement Protocol ID is a variable length field. When this field contains a vendor specific Advertisement Protocol ID then this field will be structured per the Vendor Specific information element defined in 7.3.2.26, where the Element ID of the Vendor Specific information element of 7.3.2.26 is the first octet of the field and contains the vendor specific value for Advertisement Protocol ID defined in Table 7-43bi; otherwise its length is one octet and its value is one of the values in Table 7-43bi. When one or more vendor-specific tuples are included in the Advertisement Protocol element, their total length needs to be constrained such that the total length of all the Advertisement Protocol Tuple fields (both vendor specific and otherwise) is less than or equal to 255 octets.

— ANQP supports information retrieval from an Advertisement Server. ANQP is a protocol used by a requesting STA to query another STA (i.e., the receiving STA can respond to queries with or without proxying the query to a server in an external network). See 11.23.3.2 for information on ANQP procedures.

— MIH Information Service is a service defined in IEEE Std 802.21-2008 to support information retrieval from an information repository.

Table 7-43bi—Advertisement protocol ID definitions

Name	Value
Access Network Query Protocol (ANQP)	0
MIH Information Service	1
MIH Command and Event Services Capability Discovery	2
Emergency Alert System (EAS)	3
Reserved	4 – 220
Vendor Specific	221
Reserved	222 – 255

— MIH Command and Event Services capability discovery is a mechanism defined in IEEE 802.21 (see IEEE Std 802.21-2008) to support discovering capabilities of command service and event service entities in a STA or an external network.

— The EAS allows a network to disseminate emergency alert notifications from an external network to non-AP STAs. EAS uses the message format as defined in OASIS EDXL.

— Advertisement Protocol ID 221 is reserved for Vendor Specific Advertisement Protocols. When the Advertisement Protocol ID is equal to 221, the format of the Advertisement Protocol ID subfield follows the format of the Vendor Specific information element in 7.3.2.26.

7.3.2.94 Expedited Bandwidth Request information element

The Expedited Bandwidth Request information element is transmitted from a non-AP STA to an AP in an ADDTS Request frame containing a TSPEC element and provides usage information for the bandwidth request. The Expedited Bandwidth Request element format is shown in Figure 7-95o123.

	Element ID	Length	Precedence Level
Octets:	1	1	1

Figure 7-95o123—Expedited Bandwidth Request element format

The Length field is 1.

The precedence level field is provided in Table 7-43bj.

The precedence levels are derived from the 3rd Generation Partnership Project (3GPP) document 3GPP TS 22.067 [B40].

The first responders (public) in Table 7-43bj are government agencies or entities acting on behalf of the government, and the first responders (private) are private entities, such as individuals or companies.

Table 7-43bj—Precedence Level field description

Precedence level value	Description
0 – 15	Reserved
16	Emergency call, defined in NENA 08-002 [B51]
17	First responder (public)
18	First responder (private)
19	MLPP Level A
20	MLPP Level B
21	MLPP Level 0
22	MLPP Level 1
23	MLPP Level 2
24	MLPP Level 3
25	MLPP Level 4
26 – 255	Reserved

7.3.2.95 QoS Map Set information element

The QoS Map Set information element is transmitted from an AP to a non-AP STA in a (Re)association Response frame or a QoS Map Configure frame and provides the mapping of higher layer quality of service constructs to User Priorities defined by transmission of Data frames in this standard. This information element maps the higher layer priority from the DSCP field used with the Internet Protocol to User Priority as defined by this standard. The QoS Map Set element is shown in Figure 7-95o124.

	Element ID	Length	DSCP Exception #1 (optional)	...	DSCP Exception #n (optional)	UP 0 DSCP Range	UP 1 DSCP Range	UP 2 DSCP Range	...	UP 7 DSCP Range
Octets:	1	1	2		2	2	2	2		2

Figure 7-95o124—QoS Map Set element description

The Length field is set to 16+2×n, where n is the number of Exception fields in the QoS Map set.

DSCP Exception fields are optionally included in the QoS Map Set. If included, the QoS Map Set has a maximum of 21 DSCP Exception fields. The format of the exception field is shown in Figure 7-95o125.

Figure 7-95o125—DSCP Exception format

	DSCP Value	User Priority
Octets:	1	1

The DSCP value in the DSCP Exception field is in the range 0 to 63 inclusive, or 255; the User Priority value is between 0 and 7, inclusive.

— When a non-AP STA begins transmission of a Data frame containing the Internet Protocol, it matches the DSCP field in the IP header to the corresponding DSCP value contained in this element. The non-AP STA will first attempt to match the DSCP value to a DSCP exception field and uses the UP from the corresponding UP in the same DSCP exception field if successful; if no match is found then the non-AP STA attempts to match the DSCP field to a UP n DSCP Range field, and uses the n as the UP if successful; and otherwise uses a UP of 0.

— Each DSCP Exception field has a unique DSCP Value.

	DSCP Low Value	DSCP High Value
Octets:	1	1

Figure 7-95o126—DSCP Range description

The QoS Map Set has a DSCP Range field corresponding to each of the 8 user priorities. The format of the range field is shown in Figure 7-95o126. The DSCP Range value is between 0 and 63 inclusive, or 255.

— The DSCP range for each user priority is non-overlapping.

— The DSCP High Value is greater than or equal to the DSCP Low Value.

— If the DSCP Range high value and low value are both equal to 255, then the corresponding UP is not used.

7.3.2.96 Roaming Consortium information element

The Roaming Consortium Information element contains information identifying the roaming consortium and/or SSP whose security credentials can be used to authenticate with the AP transmitting this element; see 11.23.8. The element's format is shown in Figure 7-95o127.

	Element ID	Length	Number of ANQP OIs	OI #1 and #2 Lengths	OI #1	OI #2 (optional)	OI #3 (optional)
Octets:	1	1	1	1	variable	variable	variable

Figure 7-95o127—Roaming Consortium information element format

The Length is a one-octet field whose value is equal to 2 plus the sum of the number of octets in each OI field present.

The format of the Number of ANQP OIs field is a one-octet unsigned integer whose value is the number of additional roaming consortium organization identifiers (OIs) obtainable via ANQP. A value of zero means that no additional OIs will be returned in response to a ANQP query for the Roaming Consortium list. A value of 255 means that 255 or more additional OIs are obtainable via ANQP.

The OI #1 and #2 Lengths field format is shown in Figure 7-95o128.

— The value of the OI #1 Length subfield is the length in octets of the OI #1 field.

— The value of the OI #2 Length subfield is the length in octets of the OI #2 field. If the OI #2 field is not present, the value of the OI #2 Length subfield is set to zero.

NOTE—When there are three OIs, the OI #3 Length is calculated by subtracting sum of 2 plus the value of the OI #1 Length subfield plus the value of the OI #2 Length subfield from the value of the Length field.

Bits:	B0 – B3	B4 – B7
	OI #1 Length	OI #2 Length

Figure 7-95o128—OI #1 and #2 Lengths field format

The OI field is defined in 7.3.1.31. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP. The value of the OI(s) in this table are equal to the value of the first 3 OIs in the dot11RoamingConsortiumTable. If fewer than 3 values are defined in the dot11RoamingConsortiumTable, then only as many OIs as defined in the table are populated in this element. The values of the OIs in this element are equal to the values of the first OIs, up to 3, from the table.

7.3.2.97 Emergency Alert Identifier information element

The Emergency Alert Identifier information element provides a hash to identify instances of the active EAS messages that are currently available from the network. The hash allows the non-AP STA to assess whether an EAS message advertised by an AP has been previously received and therefore whether it is necessary to download from the network. The format of the Emergency Alert Identifier information element is provided in Figure 7-95o129.

	Element ID	Length	Alert Identifier Hash
Octets:	1	1	8

Figure 7-95o129—Emergency Alert Identifier information element format

The Length is a 1-octet field whose value is equal to 8.

The Alert Identifier Hash (AIH) is a 8-octet field. It is a unique value used to indicate an instance of an EAS message. The value of this field is the hash produced by the HMAC-SHA1-64 hash algorithm operating on the EAS message.

AIH =HMAC-SHA1-64(“ES_ALERT”, Emergency_Alert_Message)

Where AIH is then truncated to the first 64 bits of this function.

Emergency_Alert_Message is the EAS message itself.

Insert the following new subclauses (7.3.4 through 7.3.4.16) after 7.3.3:

7.3.4 Access Network Query Protocol (ANQP) elements

ANQP elements are defined to have a common format consisting of a 2-octet Info ID field, a 2-octet length field, and a variable-length element-specific information field. Each element is assigned a unique Info ID as defined in this standard. The ANQP element format is shown in Figure 7-95q. See X.1 for informative text on ANQP usage.

	Info ID	Length	Information
Octets:	2	2	variable

Figure 7-95q—ANQP element format

Each ANQP element in 7.3.4 is assigned a unique 2-octet Info ID. The set of valid Info IDs are defined in Table 7-43bk. The 2-octet Info ID is encoded following the conventions given in 7.1.1.

The Length field specifies the number of octets in the Information field and is encoded following the conventions given in 7.1.1.

The ANQP elements that may be configured are shown in Table 7-43bk. If information is not configured for a particular ANQP element, then a query for that element will return that element with all optional fields not present.

Table 7-43bk—ANQP information ID definitions

Information name	Information ID	ANQP information element (clause)
Reserved	0 – 255	n/a
ANQP Query list	256	7.3.4.1
ANQP Capability list	257	7.3.4.2
Venue Name information	258	7.3.4.3
Emergency Call Number information	259	7.3.4.4
Network Authentication Type information	260	7.3.4.5
Roaming Consortium list	261	7.3.4.6
IP Address Type Availability information	262	7.3.4.8
NAI Realm list	263	7.3.4.9
3GPP Cellular Network information	264	7.3.4.10
AP Geospatial Location	265	7.3.4.11
AP Civic Location	266	7.3.4.12
AP Location Public Identifier URI	267	7.3.4.13
Domain Name list	268	7.3.4.14

Table 7-43bk—ANQP information ID definitions *(continued)*

Information name	Information ID	ANQP information element (clause)
Emergency Alert Identifier URI	269	7.3.4.15
Emergency NAI	271	7.3.4.16
Reserved	272– 56796	n/a
ANQP vendor-specific list	56797	7.3.4.7
Reserved	56798 – 65535	n/a

7.3.4.1 ANQP Query list

The ANQP Query list provides a list of identifiers of ANQP elements for which the requesting STA is querying in an ANQP Query. The ANQP Query list element is included in a GAS Query Request.

The format of the ANQP Capability list is provided in Figure 7-95t.

	Info ID	Length	ANQP Query ID #1	ANQP Query ID #2 (optional)	…	ANQP Query ID #N (optional)
Octets:	2	2	2	0 or 2	…	0 or 2

Figure 7-95r—ANQP Query list format

The Info ID is a 2-octet field whose value is drawn from Table 7-43bn corresponding to the ANQP Query list.

The Length is a 2-octet field whose value is equal to 2 times the number of ANQP Query ID fields.

Each ANQP Query ID field value is an Info ID drawn from Table 7-43bn. Including an Info ID in the ANQP Query list declares that the STA performing the ANQP Query is requesting the ANQP element corresponding to that Info ID be returned in the ANQP Query Response. The Info IDs included in the ANQP Query list are ordered by monotonically increasing Info ID value.

7.3.4.2 ANQP Capability list

The ANQP Capability list provides a list of information/capabilities that has been configured on a STA. The ANQP Capability list element is returned in response to a GAS Query Request.

The format of the ANQP Capability list is provided in Figure 7-95s.

	Info ID	Length	ANQP Capability #1	ANQP Capability #2 (optional)	…	ANQP Capability #N (optional)	ANQP Vendor-Specific list #1 (optional)	…	ANQP Vendor-Specific list #N (optional)
Octets:	2	2	2	0 or 2	…	0 or 2	variable	…	variable

Figure 7-95s—ANQP Capability list format

The Info ID is a 2-octet field whose value is drawn from Table 7-43bk corresponding to the ANQP Capability list.

The Length is a 2-octet field whose value is equal to 2 times the number of ANQP Capability fields following the Length field plus the sum of the lengths of the ANQP Vendor Specific lists.

Each ANQP Capability field value is an Info ID drawn from Table 7-43bk. If included in the ANQP Capability list, it declares that a query request for that Info ID will return the requested ANQP element. The Info ID for ANQP Capability list is always included in the ANQP Capability list returned in a GAS Query Response. The list does not include any duplicate Info IDs, except possibly the Info ID for the ANQP Vendor-specific list. The Info IDs returned in the ANQP Capability list are ordered by non-decreasing Info ID value.

The ANQP Vendor-specific list is defined in 7.3.4.7. The ANQP Vendor-specific list is structured such that the first 2 octets of the ANQP Vendor-specific list is the Info ID whose value corresponds to the ANQP Vendor-specific list (see Table 7-43bk). When an ANQP Vendor-specific list is present in the ANQP Capability list, the ANQP Vendor-specific list element contains the capabilities of that vendor-specific query protocol.

7.3.4.3 Venue Name information

The Venue Name information provides zero or more venue names associated with the BSS. The format of the Venue Name information is shown in Figure 7-95t. The Venue Name information may be used to provide additional metadata on the BSS. For example, this information may be used to assist a user in selecting the appropriate BSS with which to associate. Zero or more Venue Name fields may be included in the same or different languages.

	Info ID	Length	Venue Info	Venue Name Duple #1 (optional)	Venue Name Duple #2 (optional)	…	Venue Name Duple #N (optional)
Octets:	2	2	2	variable	variable	…	variable

Figure 7-95t—Venue Name information format

The Info ID field is equal to the value in Table 7-43bk corresponding to the Venue Name information as defined in Figure 7-95t.

The Length is a 2-octet field whose value is equal to two plus the number of octets in Venue Name Duple fields.

The Venue Info field is defined in 7.3.1.34.

The format of the Venue Name Duple field is shown in Figure 7-95u.

	Length	Language Code	Venue Name
Octets:	1	3	variable

Figure 7-95u—Venue Name Duple field

— The Length is a one octet field whose value is equal to 3 plus the number of octets in the Venue Name field.

— The Language Code field is an ISO-14962-1997 [B50] encoded string that defines the language used in the Venue Name field. The Language Code field is a two or three character language code selected from ISO-639 [B49]. A two character language code has a zero ("null" in ISO-14962-1997) appended to make it 3 octets in length.

— The Venue Name field is a UTF-8 formatted field containing the venue's name. The maximum length of this field is 252 octets. UTF-8 format is defined in RFC 3629.

7.3.4.4 Emergency Call Number information

The Emergency Call Number information provides a list of emergency phone numbers to an emergency responder, (such as directed by a public safety answering point (PSAP), that is used in a specific geographical area. The format of the Emergency Call Number information is provided in Figure 7-95v.

	Info ID	Length	Emergency Call Number Unit #1 (optional)	Emergency Call Number Unit #2 (optional)	…	Emergency Call Number Unit #N (optional)
Octets:	2	2	variable	variable	…	variable

Figure 7-95v—Emergency Call Number information format

The Info ID field is equal to the value in Table 7-43bk corresponding to the Emergency Call Number information.

The Length is a 2-octet field whose value is determined by the number and size of the Emergency Call Number Unit fields.

Each Emergency Call Number Unit field has the structure shown in Figure 7-95w.

	Length of Emergency Call Number	Emergency Call Number
Octets:	1	variable

Figure 7-95w—Emergency Call Number Unit field format

The Length of Emergency Call Number field is a one octet field whose value is determined by the size of the Emergency Call Number field.

The Emergency Call Number field indicates the dialing digits used to obtain emergency services from the network. This field is encoded using the UTF-8 character set, defined in RFC 3629.

7.3.4.5 Network Authentication Type information

The Network Authentication Type information provides a list of authentication types when ASRA is set to 1. The format of the Network Authentication Type information is shown in Figure 7-95x.

	Info ID	Length	Network Authentication Type Unit #1 (optional)	Network Authentication Type Unit #2 (optional)	…	Network Authentication Type Unit #N (optional)
Octets:	2	2	variable	variable	…	variable

Figure 7-95x—Network Authentication Type information format

The Info ID field is equal to the value in Table 7-43bk corresponding to the Network Authentication Type information.

The Length is a 2-octet field whose value is determined by the number and size of the Network Authentication Type Units.

Each Network Authentication Type Unit has the structure shown in Figure 7-95y.

	Network Authentication Type Indicator	Re-direct URL Length	Re-direct URL (optional)
Octets:	1	2	variable

Figure 7-95y—Network Authentication Type Unit field format

The Network Authentication Type Indicator has one of the values shown in Table 7-43bl.

Each Network Authentication Type Indicator defines additional information that may be communicated.

Table 7-43bl—Network Authentication Type Indicator definitions

Value	Meaning
0	Acceptance of terms and conditions
1	On-line enrollment supported
2	http/https redirection
3	DNS redirection
4 – 255	Reserved

If the Network Authentication Type Indicator is zero, the network requires the user to accept terms and conditions, the Re-direct URL Length will be set to 0 and the Re-direct URL will not be present.

If the Network Authentication Type Indicator is 1, the network supports on-line enrollment. Higher layer protocols on the non-AP STA may indicate to the user that accounts may be created. When the Network Authentication Type Indicator is 1, the Re-direct URL Length will be set to 0 and the Re-direct URL will not be present.

If the Network Authentication Type Indicator is 2 the network infrastructure performs http/https redirect.

If the Network Authentication Type Indicator is 3, the network supports DNS redirection. Higher layer software on the non-AP STA will exchange credentials with the network, the Re-direct URL Length will be set to 0 and the Re-direct URL will not be present.

The Re-direct URL Length field is a 2-octet field whose value is the length in octets of the Re-direct URL. The value of the Re-direct URL Length field is set to 0 whenever the Re-direct URL is not present.

If the Network Authentication Type Indicator is 2, a Re-direct URL may optionally be included. If the Network Authentication Type Indicator is other than 2, a Re-direct URL is not included. The URL is formatted in accordance with RFC 3986.

7.3.4.6 Roaming Consortium list

The Roaming Consortium list provides a list of information about the Roaming Consortium and/or SSPs whose networks are accessible via this AP. This list may be returned in response to a GAS Query using procedures in 11.23.3.2.2. The format of the Roaming Consortium list is provided in Figure 7-95z.

	Info ID	Length	OI Duple #1 (optional)	OI Duple #2 (optional)	…	OI Duple #N (optional)
Octets:	2	2	variable	variable		variable

Figure 7-95z—Roaming Consortium list format

The Info ID field is equal to the value in Table 7-43bk corresponding to the Roaming Consortium list.

The Length is a 2-octet field whose value is dependent on the number and size of OIs present in the element.

There are zero or more OI Duples in this list. OIs contained within the Roaming Consortium element (see 7.3.2.96) are also included in this list. The value of the OI subfield(s) in this list are equal to the values of the OI(s) in the dot11RoamingConsortiumTable.

The format of the OI Duple field is provided in Figure 7-95aa.

— The value of the OI Length field is equal to the number of octets in the OI field.

— The OI field is defined in 7.3.1.31. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP.

	OI Length	OI
Octets:	1	variable

Figure 7-95aa—OI Duple format

7.3.4.7 ANQP vendor-specific list

The ANQP vendor-specific list is used to query for information not defined in this standard within a single defined format, so that reserved Info IDs are not usurped for nonstandard purposes and inter-operability is more easily achieved in the presence of nonstandard information. The element is in the format shown in Figure 7-95ab.

	Info ID	Length	OI	Vendor Specific Content
Octets:	2	2	variable	variable

Figure 7-95ab—ANQP vendor-specific query format

The Info ID field is equal to the value in Table 7-43bk corresponding to the ANQP vendor specific list.

The Length is a 2-octet field whose value is equal to the number of octets in the OI field plus the number of octets in the Vendor-Specific Content field.

The OI field is defined in 7.3.1.31.

The Vendor-Specific Content field is content that has been defined by the entity identified in the OI field.

7.3.4.8 IP Address Type Availability Information

The IP Address Type Availability information provides STA with the information about the availability of IP address version and type that could be allocated to the STA after successful association. This information may be returned in response to a GAS Query using the procedures in 11.23.3.2. The format of the IP Address Type Availability information is shown in Figure 7-95ac.

	Info ID	Length	IP Address
Octets:	2	2	1

Figure 7-95ac—IP Address Type Availability information

The Info ID field is equal to the value in Table 7-43bk corresponding to the IP Address Type Availability information.

The Length is a 2-octet field whose value is 1.

The format of the IP Address field shown in Figure 7-95ad.

Bits:	B0 – B1	B2 – B7
	IPv6 Address	IPv4 Address

Figure 7-95ad—IP Address field format

The IPv6 Address field format is shown in Table 7-43bm.

Table 7-43bm—IPv6 Address field values

Address value	Meaning
0	Address type not available
1	Address type available
2	Availability of the address type not known
3	Reserved

The IPv4 Address field format is shown in Table 7-43bn.

Table 7-43bn— IPv4 Address field values

Address value	Meaning
0	Address type not available
1	Public IPv4 address available
2	Port-restricted IPv4 address available
3	Single NATed private IPv4 address available
4	Double NATed private IPv4 address available
5	Port-restricted IPv4 address and single NATed IPv4 address available
6	Port-restricted IPv4 address and double NATed IPv4 address available
7	Availability of the address type is not known
8 – 63	Reserved

7.3.4.9 NAI Realm list

The NAI Realm list provides a list of network access identifier (NAI) realms corresponding to SSPs or other entities whose networks or services are accessible via this AP; optionally included for each NAI realm is a list of one or more EAP Method subfields, which that NAI realm uses for authentication. The NAI Realm list may be returned in response to a GAS Query using the procedures in 11.23.3.2.3. The format of the NAI Realm list is provided in Figure 7-95ae.

	Info ID	Length	NAI Realm Count	NAI Realm Data #1 (optional)	NAI Realm Data #2 (optional)	. . .	NAI Realm Data #n (optional)
Octets:	2	2	2	variable	variable		variable

Figure 7-95ae—NAI Realm list format

The Info ID field is equal to the value in Table 7-43bk corresponding to the NAI Realm list.

The Length field is a 2-octet field whose value is 2 plus the total length of the NAI Realm Data fields.

The NAI Realm Count field is a 2-octet field that specifies the number of NAI realms included in the NAI Realm list.

The format of the NAI Realm Data field is shown in Figure 7-95af.

	NAI Realm Data Field Length	NAI Realm Encoding	NAI Realm Length	NAI Realm	EAP Method Count	EAP Method #1 (optional)	EAP Method #2 (optional)	. . .	EAP Method #n (optional)
Octets:	2	1	1	variable	1	variable	variable		variable

Figure 7-95af—NAI Realm Data field format

NAI Realm Data Field Length is a 2-octet subfield whose value is equal to 3 plus the length of the NAI Realm subfield plus the sum of the lengths of the EAP Method list subfields.

The NAI Realm Encoding is a 1-octet subfield whose format is shown in Figure 7-95ag.

The NAI Realm Encoding Type subfield is a 1-bit subfield. It is set to 0 to indicate that the NAI Realm in the NAI Realm subfield is formatted in accordance with RFC-4282. It is set to 1 to indicate it is a UTF-8 formatted character string that is not formatted in accordance with RFC-4282.

NOTE—This encoding is to facilitate roaming consortium or other entities that use non-standard NAI realm formats.

Bits:	B0	B1 – B7
	NAI Realm Encoding Type	Reserved

Figure 7-95ag—NAI Realm Encoding subfield format

NAI Realm Length subfield is a 1-octet subfield whose value is the length of the NAI Realm subfield.

The NAI Realm subfield is one or more NAI Realms formatted as defined in the NAI Realm Encoding Type bit of the NAI Realm Encoding subfield. If there is more than one NAI Realm in this subfield, the NAI Realms are delimited by a semi-colon character (i.e., “;”, which is encoded in UTF-8 format as 0x3B). All the realms included in the NAI Realm subfield support all the EAP methods identified by the EAP Method subfields, if present. The maximum length of this subfield is 255 octets.The EAP Method Count specifies the number of EAP methods subfields for the NAI realm. If the count is zero, there is no EAP method information provided for the NAI realm.

The format of the optional EAP Method subfield is shown in Figure 7-95ah. Each EAP Method subfield contains a set of Authentication Parameters associated with the EAP-Method.

	Length	EAP Method	Authentication Parameter Count	Authentication Parameter #1 (optional)	Authentication Parameter #2 (optional)	. . .	Authentication Parameter #n (optional)
Octets:	1	1	1	variable	variable		variable

Figure 7-95ah—EAP Method subfield format

The length of the EAP Method subfield is a 1-octet subfield whose value is equal to 2 plus the length of the Authentication Parameter subfields.

The EAP method subfield is a 1-octet subfield that is set to the EAP Type value as given in IANA EAP Method Type Numbers.

The Authentication Parameter Count indicates how many additional Authentication Parameter subfields are specified for the supported EAP Method. If the Authentication Parameters Count subfield is zero, there are no Authentication Parameters subfields present, meaning no additional Authentication Parameters are specified for the EAP Method.

The format of the Authentication Parameter subfield is shown in Figure 7-95ai.

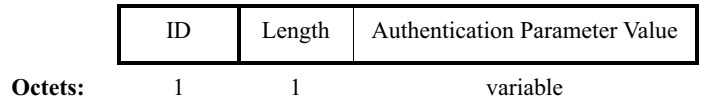

Figure 7-95ai—Authentication Parameter subfield format

The ID is a 1-octet field that indicates the type of authentication information provided.

The length of the Authentication Parameter subfield is a 1-octet subfield whose value is equal to the length in octets of the Authentication Parameter Value field.

The Authentication Parameter Value is a variable length field containing the value of the parameter indicated by the ID.

The ID and its associated formats are specified in Table 7-43bo. Each ID indicates a different type of information. Use of multiple Authentication Parameter subfields allows all the required authentication parameter requirements to be provided.

Table 7-43bo—Authentication Parameter types

Authentication Information	ID	Description	Length (octets)
Reserved	0		
Expanded EAP Method	1	Expanded EAP Method Subfield	7
Non-EAP Inner Authentication Type	2	Enum (0 - Reserved, 1 - PAP, 2 - CHAP, 3 - MSCHAP, 4 - MSCHAPV2)	1
Inner Authentication EAP Method Type	3	Value drawn from IANA EAP Method Type Numbers	1
Expanded Inner EAP Method	4	Expanded EAP Method Subfield	7
Credential Type	5	Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softoken, 6 - Certificate, 7 - username/password, 8 - none*, 9 - Reserved, 10 - Vendor Specific) *none means server-side authentication only	1

Table 7-43bo—Authentication Parameter types *(continued)*

Authentication Information	ID	Description	Length (octets)
Tunneled EAP Method Credential Type	6	Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softoken, 6 - Certificate, 7 - username/password, 8 - Reserved, 9 - Anonymous, 10 - Vendor Specific)	1
Reserved	7 – 220		
Vendor Specific	221	Variable	variable
Reserved	222 – 255		

If the EAP Method type is an Expanded EAP type (the EAP Method value is 254), the Authentication Parameter is used to specify additional information on the EAP method. Table 7-43bp describes the Authentication Parameter format for the Expanded EAP method; values for the Vendor ID and Vendor Type are specified in RFC 3748. The Vendor ID and Vendor Type fields are expressed in big endian byte order.

Table 7-43bp—Authentication Parameter format for the Expanded EAP method

Parameters	Length (octets)
ID	1
Length	1
Vendor ID	3
Vendor Type	4

The Non-EAP Inner Authentication Type is specified as single enumerated value given in Table 7-43bo. This Authentication Information type is used for non-EAP Inner Authentication methods. The possible values are PAP (as specified in RFC 1334), CHAP (as specified in RFC 1994), MSCHAP (as specified in RFC 2433), and MSCHAPv2 (as specified in RFC 2759).

The Inner Authentication EAP Method Type is specified as the EAP number as defined in IANA EAP Method Type Numbers. This Authentication Information type is used when the Inner Authentication method is an EAP method. If the Inner Authentication EAP Method Type is equal to 254 indicating an Expanded EAP Type, then the Expanded EAP Method Authentication Parameter is included.

A Credential Type can be selected by a single enumerated value as shown in Table 7-43bo. If the value is equal to the “Vendor Specific” value, then a Vendor-Specific Authentication Parameter is included.

Vendor-Specific Authentication Parameters are specified as shown in Table 7-43bq.

Table 7-43bq—Vendor-Specific Authentication Parameters

Parameters	Length (octets)
ID	1
Length	1
OI	variable
Authentication Parameter Value	Vendor-specific content

7.3.4.10 3GPP Cellular Network information

The 3GPP Cellular Network information contains cellular information such as network advertisement information e.g., network codes and country codes to assist a 3GPP non-AP STA in selecting an AP to access 3GPP networks. The format of the 3GPP Cellular Network information is shown in Figure 7-95aj.

	Info ID	Length	Payload
Octets:	2	2	variable

Figure 7-95aj—3GPP Cellular Network information format

The Info ID field is equal to the value in Table 7-43bk corresponding to the 3GPP Cellular Network information.

The Length field is a 2-octet field and is equal to the length of the Payload field.

The Payload field is a generic container whose content is defined in Annex A of 3GPP TS 24.234 v8.1.0.

7.3.4.11 AP Geospatial Location element

The AP Geospatial Location element provides the AP's location in LCI format, see 7.3.2.22.9. This list element may be returned in response to a GAS Query using the procedures in 11.23.3.2.

The format of the AP Geospatial Location element is provided in Figure 7-95ak.

	Info ID	Length	Location Configuration Report
Octets:	2	2	18

Figure 7-95ak—AP Geospatial Location format

The Length field is a 2-octet field and is equal to 18.

The format of the Location Configuration Report is provided in 7.3.2.22.9. There are no Optional Subelements field present in the Location Configuration Report when it is used in the AP Geospatial Location element. This information is taken from the dot11APLCITable MIB object.

7.3.4.12 AP Civic Location element

The AP Civic Location element provides the AP's location in Civic format. This list element may be returned in response to a GAS Query using the procedures in 11.23.3.2. The format of the AP Civic Location element is provided in Figure 7-95al.

	Info ID	Length	Location Civic Report
Octets:	2	2	variable

Figure 7-95al—AP Civic Location format

The Length field is a 2-octet field and is equal to the length of the Location Civic Report.

The format of the Location Civic Report is provided in 7.3.2.21.13. This information is taken from the dot11ApCivicLocation MIB object.

7.3.4.13 AP Location Public Identifier URI element

The AP Location Public Identifier URI element provides an indirect reference to where the location information for the AP can be retrieved. This list element may be returned in response to a GAS Query using the procedures in 11.23.3.2. The format of the AP Location Public Identifier URI element is provided in Figure 7-95am.

	Info ID	Length	Public Identifier URI
Octets:	2	2	variable

Figure 7-95am—AP Location Public Identifier URI format

The Info ID field is equal to the value in Table 7-43bk corresponding to the AP Location Public Identifier URI.

The Length field is a 2-octet field whose value is the length of the AP Location Public Identifier URI field.

The Public Identifier URI field is defined in 7.3.2.22.13.

NOTE—There are some types of uniform resources (URIs) that are not good to receive, due to security concerns. For example, any uniform resources (URLs) that can have scripts, such as "data:" URLs, and some "HTTP:" URLs that go to web pages that have scripts. Therefore, URIs received via this method should not be sent to a general-browser to connect to a web page, because they could have harmful scripts. URIs should not contain "data:" URLs, because they could contain harmful scripts. Instead of listing all the types of URIs and URLs that can be misused or potentially have harmful affects, Section 3.3 IANA registers acceptable location URI schemes (or types).

7.3.4.14 Domain Name list element

The Domain Name list element provides a list of one or more domain names of the entity operating the IEEE 802.11 access network. Domain Names in this element are taken from dot11DomainNameTable. This list element may be returned in response to a GAS Query using the procedures in 11.23.3.2. The format of the Domain Name list element is provided in Figure 7-95an.

The Length is a 2-octet field whose value is equal to the number and size of the Domain Name Fields.

	Info ID	Length	Domain Name field #1 (optional)	Domain Name field #2 (optional)	. . .	Domain Name field #N (optional)
Octets:	2	2	variable	variable		variable

Figure 7-95an—Domain Name list format

The format of the Domain Name field is shown in Figure 7-95ao.

	Length	Domain Name
Octets:	1	variable

Figure 7-95ao—Domain Name field format

The Length subfield is the length in octets of the Domain Name subfield.

The Domain Name subfield is a domain name compliant with the "Preferred Name Syntax" as defined in RFC 1035. The maximum length of this field is 255 octets.

7.3.4.15 Emergency Alert URI information

The Emergency Alert URI information provides a URI for EAS message retrieval.

The format of the Emergency Alert URI information is provided in Figure 7-95ap.

	Info ID	Length	Emergency Alert URI
Octets:	2	2	variable

Figure 7-95ap—Emergency Alert URI information format

The Length field is a 2-octet field whose value is equal to the length of the Emergency Alert Identifier URI field.

The Emergency Alert URI field is a variable-length field used to indicate the URI at which an EAS message may be retrieved. See 11.23.7. The Emergency Alert URI field is formatted in accordance with RFC 3986.

7.3.4.16 Emergency NAI element

The Emergency NAI element contains an emergency string, which can be used by a STA as its identity to indicate emergency access request. The format of the Emergency NAI element is provided in Figure 7-95aq.

	Info ID	Length	Emergency NAI String
Octets:	2	2	variable

Figure 7-95aq—Emergency NAI element format

The Length field is set to the length of Emergency NAI string.

The Emergency NAI field contains a UTF-8 string formatted in accordance with RFC4282.

7.4 Action frame format details

7.4.1 Spectrum management action details

7.4.2 QoS Action frame details

Change Table 7-45 as shown:

Table 7-45—QoS Action field values

Action field value	Meaning
0	ADDTS request
1	ADDTS response
2	DELTS
3	Schedule
4	QoS Map Configure
45 – 255	Reserved

7.4.2.1 ADDTS Request frame format

Change Table 7-46 as shown:

Table 7-46—ADDTS Request frame body

Order	Information
1	Category
2	Action
3	Dialog token
4	TSPEC
5 – n	TCLAS (optional)
n + 1	TCLAS processing (optional)
n + 2	U-APSD Coexistence (optional)
n + 3	Expedited Bandwidth Request element (optional)

Change the sixth paragraph of 7.4.2.1 as follows:

The TSPEC element, defined in 7.3.2.30, and the optional TCLAS element, defined in 7.3.2.31, contain the QoS parameters that define the TS. The TS is identified by the TSID and Direction fields within the TSPEC

element. The TCLAS element is optional at the discretion of the non-AP STA that sends the ADDTS Request frame, regardless of the setting of the access policy (EDCA or HCCA). *n* is the number of optional TCLAS elements. There may be one or more TCLAS elements in the ADDTS frame. The TCLAS Processing element is present when there are more than one TCLAS element and is defined in 7.3.2.33. There may be one Expedited Bandwidth Request element, which is defined in 7.3.2.94.

7.4.2.2 ADDTS Response frame format

Change Table 7-47 as shown:

Table 7-47—ADDTS Response frame body

Order	Information
1	Category
2	Action
3	Dialog token
4	Status Code
5	TS Delay
6	TSPEC
7 – n	TCLAS (optional)
n + 1	TCLAS processing (optional)
n + 2	Schedule
n + 3	Expedited Bandwidth Request (optional)

Change the fifth paragraph in 7.4.2.2 as shown:

The Dialog Token, TS Delay, TSPEC, TCLAS, ~~and~~ TCLAS Processing, and Expedited Bandwidth Request fields in this frame are contained in an MLME-ADDTS.response primitive that causes the frame to be sent. The TS Delay information element is present in an ADDTS Response frame only if the status code is set to 47.

Insert the following new subclause (7.4.2.5) after 7.4.2.4:

7.4.2.5 QoS Map Configure frame format

The QoS Map Configure frame is used by an AP to provide the QoS Map Set to a non-AP STA using the procedures defined in 11.23.9.

The frame body of the QoS Map Configure frame contains the information shown in Table 7-49a.

Table 7-49a—QoS Map configure frame body

Order	Information
0	Category
1	Action
2	QoS Map Set

The Category field is set to the value in Table 7-24.

The Action field is set to the value in Table 7-45.

The QoS Map Set element is defined in 7.3.2.95.

7.4.7 Public Action details

7.4.7.1 Public Action frames

Change the first paragraph of 7.4.7.1 as follows.

The Public Action frame is defined to allow inter-BSS and AP to unassociated-STA communications and GAS. The defined Public Action frames are listed in Table 7-57e.

Insert Action field values 10 through 13 into Table 7-57e as shown (note that the entire table is not shown):

Table 7-57e—Public Action field values

Action field value	Description
10	GAS Initial Request, see 7.4.7.13
11	GAS Initial Response, see 7.4.7.14
12	GAS Comeback Request, see 7.4.7.15
13	GAS Comeback Response, see 7.4.7.16

Insert the following new subclauses (7.4.7.13 through 7.4.7.16) after 7.4.7.12:

7.4.7.13 GAS Initial Request frame format

The GAS Initial Request frame is a Public Action frame. It is transmitted by a requesting STA to request information from another STA. The format of the GAS Initial Request frame body is shown in Table 7-57f6.

Table 7-57f6—GAS Initial Request frame body format

Order	Information
0	Category
1	Action
2	Dialog Token
3	Advertisement Protocol element
4	Query Request length
5	Query Request

The Category field is set to the value indicating a Public Action frame, as specified in Table 7-24.

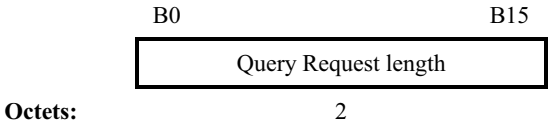
The Action field is set to the value specified in Table 7-57e for a GAS Initial Request frame.

The Dialog Token field is defined in 7.3.1.12 and set by the requesting STA.

The Advertisement Protocol element is defined in 7.3.2.93. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.

The Query Request length field is defined in Figure 7-101h10. The value of the Query Request length field is set to the total number of octets in the Query Request field.

Figure 7-101h10—Query Request length field



The Query Request field is defined in Figure 7-101h11. The Query Request field is a generic container whose value is a GAS Query that is formatted in accordance with the protocol specified in the Advertisement Protocol element.

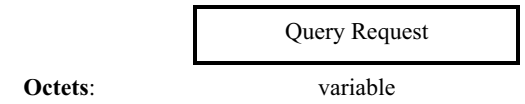


Figure 7-101h11—Query Request field

7.4.7.14 GAS Initial Response frame format

The GAS Initial Response frame is a Public Action frame. It is transmitted by a STA responding to a GAS Initial Request frame. The format of the GAS Initial Response frame body is shown in Table 7-57f7.

Table 7-57f7—GAS Initial Response frame body format

Order	Information
0	Category
1	Action
2	Dialog Token
3	Status Code
4	GAS Comeback Delay
5	Advertisement Protocol element
6	Query Response Length
7	Query Response (optional)

The Category field is set to the value indicating a Public Action frame, as specified in Table 7-24.

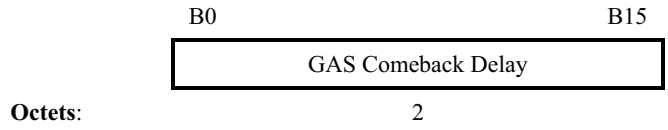
The Action field is set to the value specified in Table 7-57e for a GAS Initial Response frame.

The Dialog Token field is copied from the corresponding GAS Initial Request frame.

The Status Code values are defined in Table 7-23.

The GAS Comeback Delay field specifies the delay time value in TUs. The GAS Comeback Delay field format is provided in Figure 7-101h12. The behavior is described in 11.23.3.1. A zero value will be returned by the STA when a Query Response is provided in this frame.

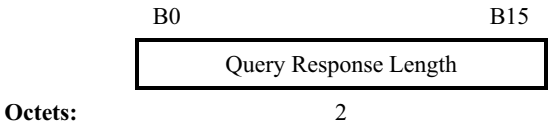
Figure 7-101h12—GAS Comeback Delay field



The Advertisement Protocol element is defined in 7.3.2.93. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.

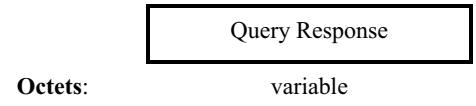
The Query Response Length field is defined in Figure 7-101h13. The value of the Query Response Length field is set to the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

Figure 7-101h13—Query Response length field



The Query Response field is defined in Figure 7-101h14. The Query Response field is a generic container whose value is the response to a GAS Query and is formatted in accordance with the protocol specified in the Advertisement Protocol element.

Figure 7-101h14—Query Response field



7.4.7.15 GAS Comeback Request frame format

The GAS Comeback Request frame is a Public Action frame. It is transmitted by a requesting STA to a responding STA. The format of the GAS Comeback Request frame body is shown in Table 7-57f8.

Table 7-57f8—GAS Comeback Request frame body format

Order	Information
0	Category
1	Action
2	Dialog Token

The Category field is set to the value indicating a Public Action frame, as specified in Table 7-24.

The Action field is set to the value specified in Table 7-57e for a GAS Comeback Request frame.

The Dialog Token field is copied from the corresponding GAS Initial Request frame.

7.4.7.16 GAS Comeback Response frame format

The GAS Comeback Response frame is a Public Action frame. It is transmitted by a responding STA to a requesting STA. The format of the GAS Comeback Response frame body is shown in Table 7-57f9.

Table 7-57f9—GAS Comeback Response frame body format

Order	Information
0	Category
1	Action
2	Dialog Token
3	Status Code
4	GAS Query Response Fragment ID
5	GAS Comeback Delay
6	Advertisement Protocol element
7	Query Response Length
8	Query Response (optional)

The Category field is set to the value indicating a Public Action frame, as specified in Table 7-24.

The Action field is set to the value specified in Table 7-57e for a GAS Comeback Response frame.

The Dialog Token field is copied from the Dialog Token field of the corresponding GAS Comeback Request frame. The same dialog token value will be present in all fragments of a multi-fragment query response.

The Status Code values are defined in Table 7-23. The same status code value will be present in all fragments of a multi-fragment query response.

The GAS Query Response Fragment ID is defined in 7.3.1.33. If the responding STA has not received a response to the query that it posted on behalf of a requesting STA, then the responding STA sets the GAS

Query Response Fragment ID to 0. When there is more than one query response fragment, the responding STA sets the GAS Query Response Fragment ID to 0 for the initial fragment and increments it by 1 for each subsequent fragment in a multi-fragment Query Response. The More GAS Fragments field is set to 0 whenever the final fragment of a query response is being transmitted. A GAS Query Response Fragment ID field having a nonzero Fragment ID and the More GAS Fragments field set to 1 indicates to the requesting STA that another GAS Comeback frame exchange should be performed to continue the retrieval of the query response.

The GAS Comeback Delay field format is provided in Figure 7-101h12. A nonzero GAS Comeback Delay value is returned by the responding STA in this frame to indicate that the GAS Query being carried out on behalf of the requesting STA is still in progress.

— A nonzero value indicates to the requesting STA that another GAS Comeback frame exchange should be performed after expiry of the GAS Comeback Delay timer in order to retrieve the query response.

— This field is set to 0 for all GAS Comeback Response frames containing a query response or a fragment of a multi-fragment query response.

The Advertisement Protocol element is defined in 7.3.2.93. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.

The Query Response Length field is defined in Figure 7-101h13. The value of the Query Response Length field is the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

The Query Response field is defined in Figure 7-101h14. The value of the Query Response field is a generic container dependent on the advertisement protocol specified in the Advertisement Protocol element and the query itself. In a multi-fragment query response, the response to the query posted on behalf of a requesting STA is fragmented such that each fragment to be transmitted fits within the MMPDU size limitation.

7.4.9 SA Query Action frame details

7.4.9a Protected Dual of Public Action details

7.4.9a.1 Protected Dual of Public Action frames

Insert Action field values 10 through 13 and change the Reserved row in Table 7-57m as shown (note that the entire table is not shown here):

Table 7-57m—Protected Dual of Public Action field values

Action Field Value	Description
10	GAS Initial Request
11	GAS Initial Response
12	GAS Comeback Request
13	GAS Comeback Response
~~9~~14 – 255	Reserved

8. Security

Insert the following subclause (8.1.6) after 8.1.5:

8.1.6 Emergency service establishment in an RSN

An AP that supports RSNAs and has the UESA bit set to 1 in the Interworking element in Beacon and Probe Response frames, supports both RSNAs and emergency services associations (see 11.3.2.1) simultaneously.

NOTE—STAs with emergency services association are advised to discard all group addressed frames they receive, as they do not posses the Group Key and will not be able to decrypt group addressed frames. In an RSNA enabled BSS having one or more STAs associated with an emergency services association, an AP should avoid transmitting unprotected group addressed frames to not disturb the operation of STAs in possession of Group Key. One possible way of achieving this is to support Proxy-ARP in the AP, as defined in 11.22.13. In addition, it is recommended that an AP supporting emergency services association should also support DMS to convert group addressed frames to individually addressed frames and transmit them to STAs associated using the emergency services association. STAs using emergency services association could request for DMS if needed.

9. MAC sublayer functional description

9.2 DCF

9.2.7 Broadcast and multicast MPDU transfer procedure

Change the first paragraph of 9.2.7 as follows:

In the absence of a PCF, when broadcast or group addressed MPDUs are transferred from a STA with the To DS field clear, only the basic access procedure shall be used. Regardless of the length of the frame, no RTS/CTS exchange shall be used. In addition, no ACK shall be transmitted by any of the recipients of the frame. Any broadcast or group addressed MPDUs transferred from a STA with a To DS field set shall, in addition to conforming to the basic access procedure of CSMA/CA, obey the rules for RTS/CTS exchange and the ACK procedure because the MPDU is directed to the AP. When dot11SSPNInterfaceActivated is true, an AP shall distribute the broadcast/multicast message into the BSS only if dot11NonAPStationAuthSourceMulticast in the dot11InterworkingEntry identified by the source MAC address in the received message is true. When dot11SSPNInterfaceActivated is false, t~~T~~he broadcast/multicast message shall be distributed into the BSS. The STA originating the message shall receive the message as a broadcast/multicast message. Therefore, all STAs shall filter out broadcast/multicast messages that contain their address as the source address. When dot11SSPNInterfaceActivated is false, ~~B~~broadcast and multicast MSDUs shall be propagated throughout the ESS. When dot11SSPNInterfaceActivated is true, broadcast and multicast MSDUs shall be propagated throughout the ESS only if dot11NonAPStationAuthSourceMulticast in the dot11InterworkingEntry identified by the source MAC address in the received message is true.

9.9 HCF

9.9.3.1 Contention-based admission control procedures

Change the second paragraph of 9.9.3.1 as follows:

The AP uses the ACM (admission control mandatory) subfields advertised in the EDCA Parameter Set element to indicate whether admission control is required for each of the ACs. While the CWmin, CWmax, AIFS, TXOP limit parameters may be adjusted over time by the AP, the ACM field shall be static for the duration of the lifetime of the BSS. An ADDTS Request frame shall be transmitted by a non-AP STA to the

HC in order to request admission of traffic in any direction (i.e., uplink, downlink, direct, or bidirectional) employing an AC that requires admission control. The ADDTS Request frame shall contain the UP associated with the traffic and shall indicate EDCA as the access policy. The AP shall associate the received UP of the ADDTS Request frame with the appropriate AC as per the UP-to-AC mappings described in 9.1.3.1. The non-AP STA may transmit unadmitted traffic for the ACs for which the AP does not require admission control. If a STA desires to send data without admission control using an AC that mandates admission control, the STA shall use EDCA parameters that correspond to a lower priority and do not require admission control. All ACs with priority higher than that of an AC with an ACM flag equal to 1 should have the ACM flag set to 1. The HC contained within an AP when dot11SSPNInterfaceActivated is true shall admit a non-AP STA's request based on the value of dot11NonAPStationAuthAccessCategories stored in that non-AP STA's dot11InterworkingEntry, which is part of the dot11InterworkingTable. The dot11InterworkingEntry specifies the EDCA access classes and throughput limitations on each access class for which a non-AP STA is permitted to transmit.

9.9.3.1.1 Procedures at the AP

Change the second paragraph of 9.9.3.1.1 as follows:

The algorithm used by the AP to make this determination is an AP local matter. An AP when dot11SSPNInterfaceActivated is true shall use the policies delivered by the SSPN that are stored in the dot11InterworkingEntry, which is part of the dot11InterworkingTable. If the AP decides to accept the request, the AP shall also derive the medium time from the information conveyed in the TSPEC element in the ADDTS Request frame. The AP may use any algorithm in deriving the medium time, but K.2.2 provides a procedure that may be used. Having made such a determination, the AP shall transmit a TSPEC element to the requesting non-AP STA contained in an ADDTS Response frame. If the AP is accepting the request, the Medium Time field shall be specified.

9.9.3.2 Controlled-access admission control

Insert the following list item at the end of the dashed list after the second paragraph of 9.9.3.2:

— The HC shall admit its request based on Infrastructure Authorization Information in dot11InterworkingEntry, which is part of the dot11InterworkingTable. The dot11InterworkingEntry specifies whether a non-AP STA is permitted to use HCCA, its throughput limitation and its minimum delay bound.

10. Layer management

10.3 MLME SAP Interface

10.3.2 Scan

10.3.2.1 MLME-SCAN.request

10.3.2.1.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.2.1.2 as shown:

MLME-SCAN.request
BSSType,
BSSID,
SSID,
ScanType,
ProbeDelay,

Channellist,
MinChannelTime,
MaxChannelTime,
RequestInformation,
SSID List,
ChannelUsage,
AccessNetworkType,
HESSID,
VendorSpecificInfo)

Insert the following rows before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.2.1.2:

Name	Type	Valid range	Description
AccessNetwork-Type	As defined in Table 7-43bh	0 to 15	Specifies a desired specific Access Network Type or the wildcard Access Network Type. This field is present when dot11InterworkingServiceActivated is true.
HESSID	MAC Address	Any valid individual MAC address or the broadcast MAC address	Specifies the desired specific HESSID network identifier or the wildcard network identifier. This field is present when dot11InterworkingServiceActivated is true.

10.3.6 Associate

10.3.6.1 MLME-ASSOCIATE.request

10.3.6.1.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.6.1.2 as shown:

MLME-ASSOCIATE.request (
PeerSTAAddress,
AssociateFailureTimeout,
CapabilityInformation,
ListenInterval,
Supported Channels,
RSN,
QoSCapability,
Content of FT Authentication Information Elements,
SupportedRegulatoryClasses,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
QoSTrafficCapability,
TIMBroadcastRequest,
EmergencyServices,
VendorSpecificInfo)

Insert the following row before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.6.1.2:

Name	Type	Valid range	Description
EmergencyServices	Boolean	True, False	Specifies that the non-AP STA intends to associate for the purpose of unauthenticated access to emergency services. The parameter shall only be present if dot11InterworkingServiceActivated is true.

10.3.6.2 MLME-ASSOCIATE.confirm

10.3.6.2.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.6.2.2 as shown:

MLME-ASSOCIATE.confirm (
ResultCode,
CapabilityInformation,
AssociationID,
SupportedRates,
EDCAParameterSet,
RCPI.request,
RSNI.request,
RCPI.response,
RSNI.response,
RRMEnabledCapabilities,
Content of FT Authentication Information Elements,
SupportedRegulatoryClasses,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
BSSMaxIdlePeriod,
TIMBroadcastResponse,
QosMapSet,
VendorSpecificInfo)

Change the ResultCode row and insert a QoSMapSet row before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.6.2.2:

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, TIMEOUT, REFUSED_REASON_UNSPECIFIED, REFUSED_NOT_AUTHENTICATED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REJECTED_FOR_DELAY_PERIOD, TRANSMISSION_FAILURE	Indicates the result of the MLMEASSOCIATE.request.
QoSMapSet	As defined in frame format	As defined in 7.3.2.95	Specifies the QoS Map Set the non-AP STA should use.

10.3.6.4 MLME-ASSOCIATE.response

10.3.6.4.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.6.4.2 as shown:

MLME-ASSOCIATE.response
PeerSTAAddress,
ResultCode,
CapabilityInformation,
AssociationID,
EDCAParameterSet,
RCPI,
RSNI,
RRMEnabledCapabilities,
Content of FT Authentication Information Elements,
SupportedRegulatoryClasses,
DSERegisteredLocation,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
BSSMaxIdlePeriod,
TIMBroadcastResponse,
QoSMapSet,
VendorSpecificInfo)

Change the ResultCode row and insert a QoSMapSet row before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.6.4.2:

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, TIMEOUT, REFUSED_REASON_UNSPECIFIED, REFUSED_NOT_AUTHENTICATED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REJECTED_FOR_DELAY_PERIOD, TRANSMISSION_FAILURE	Indicates the result response to the association request from the peer MAC entity.
QoSMapSet	As defined in frame format	As defined in 7.3.2.95	Specifies the QoS Map Set the non-AP STA should use.

10.3.7 Reassociate

10.3.7.1 MLME-REASSOCIATE.request

10.3.7.1.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.7.1.2 as shown:

MLME-REASSOCIATE.request (
NewAPAddress,
ReassociateFailureTimeout,
CapabilityInformation,

ListenInterval,
Supported Channels,
RSN,
QoSCapability,
Content of FT Authentication Information Elements,
SupportedRegulatoryClasses,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
QoSTrafficCapability,
TIMBroadcastRequest,
FMSRequest,
DMSRequest,
EmergencyServices,
VendorSpecificInfo)

Insert the following row before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.7.1.2:

Name	Type	Valid range	Description
EmergencyServices	Boolean	True, False	Specifies that the non-AP STA intends to associate for the purpose of unauthenticated access to emergency services. The parameter shall only be present if dot11InterworkingServiceActivated is true.

10.3.7.2 MLME-REASSOCIATE.confirm

10.3.7.2.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.7.2.2 as shown:

MLME-REASSOCIATE.confirm (
ResultCode,
CapabilityInformation,
AssociationID,
SupportedRates,
EDCAParameterSet,
RCPI.request,
RSNI.request,
RCPI.response,
RSNI.response,
RRMEnabledCapabilities,
Content of FT Authentication Information Elements,
SupportedRegulatoryClasses,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
BSSMaxIdlePeriod,
TIMBroadcastResponse,
FMSResponse,
DMSResponse,
QoSMapSet,
VendorSpecificInfo)

Change the ResultCode row and insert a QoSMapSet row before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.7.2.2:

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, TIMEOUT, REFUSED_REASON_UNSPECIFIED, REFUSED_NOT_AUTHENTICATED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REJECTED_FOR_DELAY_PERIOD, TRANSMISSION_FAILURE	Indicates the result of the MLMEASSOCIATE.request.
QoSMapSet	As defined in frame format	As defined in 7.3.2.95	Specifies the QoS Map Set the non-AP STA should use.

10.3.7.4 MLME-REASSOCIATE.response

10.3.7.4.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.7.4.2 as shown:

MLME-REASSOCIATE.response (
PeerSTAAddress,
ResultCode,
CapabilityInformation,
AssociationID,
EDCAParameterSet,
RCPI,
RSNI,
RRMEnabledCapabilities,
Content of FT Authentication Information Elements,
SupportedRegulatoryClasses,
DSERegisteredLocation,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
BSSMaxIdlePeriod,
TIMBroadcastResponse,
FMSResponse,
DMSResponse,
QoSMapSet,
VendorSpecificInfo)

Change the ResultCode row and insert a QoSMapSet row before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.7.4.2:

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, TIMEOUT, REFUSED_REASON_UNSPECIFIED, REFUSED_NOT_AUTHENTICATED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REJECTED_FOR_DELAY_PERIOD, TRANSMISSION_FAILURE	Indicates the result response to the reassociation request from the peer MAC entity.
QoSMapSet	As defined in frame format	As defined in 7.3.2.95	Specifies the QoS Map Set the non-AP STA should use.

10.3.10 Start

10.3.10.1 MLME-START.request

10.3.10.1.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.10.1.2 as shown:

MLME-START.request(
SSID,
BSSType,
BeaconPeriod,
DTIMPeriod,
CF parameter set,
PHY parameter set,
IBSS parameter set,
ProbeDelay,
CapabilityInformation,
BSSBasicRateSet,
OperationalRateSet,
Country,
IBSS DFS Recovery Interval,
EDCAParameterSet,
DSERegisteredLocation,
HT Capabilities,
HT Operation,
BSSMembershipSelectorSet,
BSSBasicMCSSet,
HTOperationalMCSSet,
Extended Capabilities,
20/40 BSS Coexistence,
Overlapping BSS Scan Parameters,
MultipleBSSID,
InterworkingInfo,
AdvertismentProtocolInfo,
RoamingConsortiumInfo,
VendorSpecificInfo)

Insert the following rows before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.10.1.2:

Name	Type	Valid range	Description
InterworkingInfo	As defined in frame format	As defined in Interworking element in 7.3.2.92	Specifies the Interworking capabilities of STA. This field is present when dot11InterworkingServiceActivated is true.
Advertisement-ProtocolInfo	Integer or Sequence of Integers	As defined in Advertisement Protocol element in Table 7-43bi	Identifies zero or more Advertisement Protocols and advertisement control to be used in the BSSs. This field is present when dot11InterworkingServiceActivated is true.
RoamingConsor-tiumInfo	As defined in frame format	As defined in roaming consortium element in 7.3.2.96	Specifies identifying information for SSPs whose security credentials can be used to authenticate with the AP. This field may be present when dot11InterworkingServiceActivated is true

10.3.24 TS management interface

10.3.24.1 MLME-ADDTS.request

10.3.24.1.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.24.1.2 as shown:

MLME-ADDTS.request(
DialogToken,
TSPEC,
TCLAS,
TCLASProcessing,
ADDTSFailureTimeout,
U-APSD Coexistence,
EBR,
VendorSpecificInfo)

Insert the following row before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.24.1.2:

Name	Type	Valid range	Description
EBR	As defined in frame format	As defined in 7.3.2.94	Specifies the precedence level of the TS request. This element may be present when dot11EBRActivated is true.

10.3.24.2 MLME-ADDTS.confirm

10.3.24.2.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.24.2.2 as shown:

MLME-ADDTS.confirm(
ResultCode,
DialogToken,
TSDelay,
TSPEC,

Schedule,
TCLAS,
TCLASProcessing,
EBR,
VendorSpecificInfo)

Change the ResultCode row and insert an EBR row before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.24.2.2:

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, REJECTED_WITH_SUGGESTED_CHANGES, REJECTED_FOR_DELAY_PERIOD, TIMEOUT, TRANSMISSION_FAILURE, REJECTED_WITH_SUGGESTED_BSS_TRANSITION, REQUESTED_TCLAS_NOT_SUPPORTED, TCLAS_RESOURCES_EXHAUSTED, REJECTED_HOME_WITH_SUGGESTED_CHANGES, REJECTED_FOR_SSP_PERMISSIONS	Indicates the results of the corresponding MLME-ADDTS.request primitive.
EBR	As defined in frame format	As defined in 7.3.2.94	Specifies the precedence level of the TS request. This element may be present when dot11EBRActivated is true.

Change the second paragraph of 10.3.24.2.2 as follows:

For other values of ResultCode, no new TS has been created. In the case of REJECTED_WITH_SUGGESTED_CHANGES, the TSPEC represents an alternative proposal by the HC based on information about the current status of the MAC entity. In the case of REJECTED_HOME_WITH_SUGGESTED_CHANGES, the TSPEC represents an alternative proposal by the HC based on information received from the SSPN interface. A TS is not created with this definition. If the suggested changes are acceptable to the non-AP STA, it is the responsibility of the non-AP STA to set up the TS with the suggested changes.

10.3.24.3 MLME-ADDTS.indication

10.3.24.3.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.24.3.2 as shown:

MLME-ADDTS.indication(
DialogToken,
Non-APSTAAddress,
TSPEC,
TCLAS,
TCLASProcessing,
U-APSD Coexistence,
EBR,
VendorSpecificInfo)

Insert the following row before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.24.3.2:

Name	Type	Valid range	Description
EBR	As defined in frame format	As defined in 7.3.2.94	Specifies the precedence level of the TS request. This element may be present when dot11EBRActivated is true.

10.3.24.4 MLME-ADDTS.response

10.3.24.4.2 Semantics of the service primitive

Change the primitive parameter list in 10.3.24.4.2 as follows:

MLME-ADDTS.response (
ResultCode,
DialogToken,
Non-APSTAAddress,
TSDelay,
TSPEC,
Schedule,
TCLAS,
TCLASProcessing,
EBR,
VendorSpecificInfo)

Change the ResultCode row and insert an EBR row before the VendorSpecificInfo row of the untitled table defining the primitive parameters in 10.3.24.4.2:

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, REJECTED_WITH_SUGGESTED_CHANGES, REJECTED_FOR_DELAY_PERIOD, TIMEOUT, TRANSMISSION_FAILURE, REJECTED_WITH_SUGGESTED_BSS_TRANSITION, REQUESTED_TCLAS_NOT_SUPPORTED, TCLAS_RESOURCES_EXHAUSTED, REJECTED_HOME_WITH_SUGGESTED_CHANGES, REJECTED_FOR_SSP_PERMISSIONS	Indicates the results of the corresponding MLMEAD-DTS.request primitive.
EBR	As defined in frame format	As defined in 7.3.2.94	Specifies the precedence level of the TS request. This element may be present when dot11EBRActivated is true.

Change the third paragraph in 10.3.24.4.2 as follows:

If the result code is REJECTED_WITH_SUGGESTED_CHANGES or REJECTED_HOME_WITH_SUGGESTED_CHANGES, the TSPEC and TCLAS parameters represent an alternative proposed TS either based on information local to the MAC entity, or using additional information received across the SSPN

interface. The TS, however, is not created. The TSID and direction values within the TSPEC are as in the matching MLME-ADDTS.indication primitive. The difference may lie in the QoS (e.g., minimum data rate, mean data rate, and delay bound) values, as a result of admission control performed at the SME of the HC on the TS requested to be added (or modified) by the non-AP STA. If sufficient bandwidth is not available, the QoS values may be reduced. In one extreme, the minimum data rate, mean data rate, and delay bound may be all set to 0, indicating that no QoS is to be provided to this TS.

Insert the following subclauses (10.3.74 through 10.3.76.1.4) after 10.3.73.3.4:

10.3.74 Network discovery and selection support

This set of primitives supports the process of GAS.

10.3.74.1 MLME-GAS.request

10.3.74.1.1 Function

This primitive requests the information of a specific advertisement service from another STA and requests the STA to provide GAS.

10.3.74.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GAS.request(
        PeerSTAAddress,
        DialogToken,
        AdvertisementProtocolID,
        Query,
        QueryFailureTimeout
        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MacAddress	Specifies the address of the peer MAC entity to which query is transmitted.
DialogToken	Integer	0 – 255	The dialog token to identify the GAS transaction.
Advertisement-ProtocolID	Integer or Sequence of Integers	As defined in Table 7-43bi	This contains an Advertisement Protocol ID (see 7.3.2.93), which may be IEEE 802.11 assigned or vendor specified.
Query	String	N/A	Query string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.
QueryFailure-Timeout	Integer	> 1	The time limit, in units of Beacon intervals, after which the GAS Query procedure will be terminated.

10.3.74.1.3 When generated

This primitive is generated by the SME at a STA to request a specific Advertisement Service from another STA.

10.3.74.1.4 Effect of receipt

The STA operates according to the procedures defined in 11.23.3.

10.3.74.2 MLME-GAS.confirm

10.3.74.2.1 Function

This primitive reports the status code and Query Response from an Advertisement Server to the requesting STA.

10.3.74.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GAS.confirm(
    PeerSTAAddress,
    DialogToken,
    ResultCode,
    ResponseInfo
    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MacAddress	Specifies the address of the peer MAC entity to which query is transmitted.
DialogToken	Integer	0 – 255	The dialog token to identify the GAS transaction.
ResultCode	Enumeration	SUCCESS, TIMEOUT, UNSPECIFIED_FAILURE, ADVERTISEMENT_PROTOCOL_NOT_SUPPORTED, QUERY_RESPONSE_TOO_LARGE, SERVER_UNREACHABLE, TRANSMISSION_FAILURE	Indicates the result response to the GAS request from the peer MAC entity.
ResponseInfo	String	N/A	Query Response string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.

The mapping of Status Code received in the GAS Response frame is mapped to the corresponding Result Code in Table 11-14.

10.3.74.2.3 When generated

This primitive is generated by the MLME as a response to the MLME-GAS.request primitive indicating the result of that request.

The primitive is generated when the requesting STA receives a query response in a GAS Initial Response frame or one or more GAS Comeback Response frames.

10.3.74.2.4 Effect of receipt

The STA operates according to the procedures defined in 11.23.3.

10.3.74.3 MLME-GAS.indication

10.3.74.3.1 Function

This primitive reports to the STA's SME about the GAS Request.

10.3.74.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GAS.indication(
        PeerSTAAddress,
        DialogToken,
        AdvertisementProtocolID,
        Query
        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the query message was received.
DialogToken	Integer	0 – 255	The dialog token to identify the GAS transaction.
Advertisement-ProtocolID	Integer or Sequence of Integers	As defined in Table 7-43bi	This contains an Advertisement Protocol ID (see 7.3.2.93), which may be IEEE 802.11 assigned or vendor specified.
Query	String	N/A	Query string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.

10.3.74.3.3 When generated

This primitive is generated by the MLME as a result of receipt of a GAS request from STA.

10.3.74.3.4 Effect of receipt

The SME is notified of the request from the STA.

The SME operates according to the procedures defined in 11.23.3.

The SME generates an MLME-GAS.response primitive within a dot11GASResponseTimeout.

10.3.74.4 MLME-GAS.response

10.3.74.4.1 Function

This primitive responds to the request for an advertisement service by a specified STA MAC entity.

10.3.74.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GAS.response (
    PeerSTAAddress,
    DialogToken,
    ResultCode,
    ResponseInfo
    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity to which query response information is transmitted.
DialogToken	Integer	0 – 255	The dialog token to identify the GAS transaction.
ResultCode	Enumeration	SUCCESS, NO_OUTSTANDING_REQUEST, ADVERTISEMENT_PROTOCOL_NOT_ SUPPORTED, QUERY_RESPONSE_OUTSTANDING, QUERY_RESPONSE_TOO_LARGE, SERVER_UNREACHABLE, TIMEOUT	Indicates the result response to the GAS-request from the peer MAC entity. See Table 11-14.
ResponseInfo	String	N/A	Query Response string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.

10.3.74.4.3 When generated

This primitive is generated by the MLME at a STA as a result of an MLME-GAS.indication primitive.

10.3.74.4.4 Effect of receipt

This primitive causes the MAC entity at the STA to send a GAS Initial Response frame to the requesting STA and optionally one or more GAS Comeback Response frames.

10.3.75 Protected dual of network discovery and selection support

This set of primitives supports the process of GAS using Protected Dual of Public Action frames.

10.3.75.1 MLME-PDGAS.request

10.3.75.1.1 Function

This primitive requests the information of a specific advertisement service from another STA and requests the STA to provide GAS.

10.3.75.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-PDGAS.request(
    PeerSTAAddress,
    DialogToken,
    AdvertisementProtocolID,
    Query,
    QueryFailureTimeout
    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MacAddress	Specifies the address of the peer MAC entity to which query is transmitted.
DialogToken	Integer	0 – 255	The dialog token to identify the GAS transaction.
Advertisement-ProtocolID	Integer or Sequence of Integers	As defined in Table 7-43bi	This contains an Advertisement Protocol ID (see 7.3.2.93), which may be IEEE 802.11 assigned or vendor specified.
Query	String	N/A	Query string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.
QueryFailure-Timeout	Integer	> 1	The time limit, in units of Beacon intervals, after which the GAS Query procedure will be terminated.

10.3.75.1.3 When generated

This primitive is generated by the SME at a STA to query an Advertisement Server.

10.3.75.1.4 Effect of receipt

The STA operates according to the procedures defined in 11.23.3

10.3.75.2 MLME-PDGAS.confirm

10.3.75.2.1 Function

This primitive reports the status code and query response to a GAS Query of a specific advertisement service from a STA.

10.3.75.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-PDGAS.confirm(
        PeerSTAAddress,
        DialogToken,
        ResultCode,
        ResponseInfo
        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MacAddress	Specifies the address of the peer MAC entity to which query is transmitted.
DialogToken	Integer	0 – 255	The dialog token to identify the GAS transaction.
ResultCode	Enumeration	SUCCESS, TIMEOUT, UNSPECIFIED_FAILURE, ADVERTISEMENT_PROTOCOL_NOT_ SUPPORTED, QUERY_RESPONSE_TOO_LARGE, SERVER_UNREACHABLE, TRANSMISSION_FAILURE	Indicates the result response to the GAS request from the peer MAC entity.
ResponseInfo	String	N/A	Query Response string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.

The mapping of Status Code received in the GAS Response frame is mapped to the corresponding Result Code in Table 11-14.

10.3.75.2.3 When generated

This primitive is generated by the MLME as a response to the MLME-GAS.request primitive indicating the result of that request. This primitive is used when Management Frame Protection is negotiated.

The primitive is generated when the requesting STA receives a query response in a GAS Initial Response frame or one or more GAS Comeback Response frames.

10.3.75.2.4 Effect of receipt

The STA operates according to the procedures defined in 11.23.3.

10.3.75.3 MLME-PDGAS.indication

10.3.75.3.1 Function

This primitive reports to the STA's SME about the GAS Request.

10.3.75.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-PDGAS.indication(
    PeerSTAAddress,
    DialogToken,
    AdvertisementProtocolID,
    Query
    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the query message was received.
DialogToken	Integer	0 – 255	The dialog token to identify the GAS transaction.
Advertisement-ProtocolID	Integer or Sequence of Integers	As defined in Table 7-43bi	This contains an Advertisement Protocol ID (see 7.3.2.93), which may be IEEE 802.11 assigned or vendor specified.
Query	String	N/A	Query string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.

10.3.75.3.3 When generated

This primitive is generated by the MLME as a result of receipt of a GAS request from STA. This primitive is used when Management Frame Protection is negotiated.

10.3.75.3.4 Effect of receipt

The SME is notified of the request from the STA.

The SME operates according to the procedures defined in 11.23.3.

The SME generates an MLME-PDGAS.response primitive within a dot11GASResponseTimeout.

10.3.75.4 MLME-PDGAS.response

10.3.75.4.1 Function

This primitive responds to the request for an advertisement service by a specified STA MAC entity.

10.3.75.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-PDGAS.response(
PeerSTAAddress,
DialogToken,
ResultCode,
ResponseInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity to which query response information is transmitted.
DialogToken	Integer	0 – 255	The dialog token to identify the GAS transaction.
ResultCode	Enumeration	SUCCESS, NO_REQUEST_OUTSTANDING, ADVERTISEMENT_PROTOCOL_NOT_SUPPORTED, QUERY_RESPONSE_OUTSTANDING, QUERY_RESPONSE_TOO_LARGE, SERVER_UNREACHABLE, TIMEOUT	Indicates the result response to the GAS-request from the peer MAC entity. See 11.4
ResponseInfo	String	N/A	Query Response string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.

10.3.75.4.3 When generated

This primitive is generated by the MLME at a STA as a result of an MLME-GAS.indication primitive. This primitive is used when Management Frame Protection is negotiated.

10.3.75.4.4 Effect of receipt

This primitive causes the MAC entity at the responding STA to send a GAS Initial Response frame and optionally one or more GAS Comeback Response frames to the requesting STA.

10.3.76 QoS Map Set element management

The QoS Map Set element is provided to non-AP STAs in (Re)Association Response frames. However, if the SME of an AP detects a change of the QoS Map information while one or more non-AP STAs are associated to the BSS, then the AP may transmit an unsolicited QoS Map Set element to associated STAs. The AP's SME invokes the MLME-QoSMap.request primitive to cause individually addressed frames containing a QoS Map Set element to be transmitted to associated STAs. The AP's SME invokes the MLME-QoSMap.request primitive to transmit individually addressed frames containing a QoS Map Set

element to associated STAs. When a non-AP STA receives such unsolicited QoS Map information, its MLME generates a MLME-QoSMap.indication to the STA's SME. In turn, the SME should take appropriate action, e.g., initiate an ADDTS or DELTS if admission control changes are necessary.

10.3.76.1 MLME-QoSMap.request

10.3.76.1.1 Function

This primitive is used by an AP to transmit an unsolicited QoS Map Set to a specified non-AP STA MAC entity. The specified non-AP STA MAC address is an individual MAC address.

10.3.76.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QoSMap.request(
    Non-APSTAAddress,
    QoSMapSet
    )
```

Name	Type	Valid range	Description
Non-APSTAAd-dress	MacAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity from which query message is received.
QoSMapSet	As defined in frame format	As defined in 7.3.2.95	Specifies the QoS Map Set the non-AP STA should use.

10.3.76.1.3 When generated

This primitive is generated by the MLME at the AP as a result of any change in the AP QoS Map configurations.

10.3.76.1.4 Effect of receipt

This primitive causes the MAC entity at the AP to send a QoS MAP Set element in a QoS MAP Configure frame to the non-AP STA.

10.3.76.2 MLME-QoSMap.indication

10.3.76.2.1 Function

This primitive reports the QoS mapping information sent from the AP to the non-AP STA.

10.3.76.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QoSMap.indication(
    QoSMapSet
    )
```

Name	Type	Valid range	Description
QoSMapSet	As defined in frame format	As defined in 7.3.2.95	Specifies the QoS Map Set to be used by the non-AP STA.

10.3.76.2.3 When generated

This primitive is generated when the non-AP STA receives a QoS Map Set element in an unsolicited QoS Map Configure frame from the AP.

The SME of the non-AP STA should use the information to decide proper actions. For example, an ADDTS or DELTS procedure should be activated if the QoS Map information indicates a change in the admission control.

10.3.76.2.4 Effect of receipt

The non-AP STA operates according to the procedures defined in 11.23.9.

11. MLME

11.1 Synchronization

11.1.3 Acquiring synchronization, scanning

Change the second paragraph of 11.1.3 as follows:

Active scanning is prohibited in some frequency bands and regulatory domains. The MAC of a STA receiving an MLME-SCAN.request shall use the regulatory domain information it has to process the request and shall return a result code of NOT_SUPPORTED to a request for an active scan if regulatory domain information indicates ~~an~~ any active scan is illegal. Where regulations permit active scanning after certain conditions are met, the active scan shall proceed after those conditions are met.

11.1.3.2 Active scanning

11.1.3.2.1 Sending a probe response

Change the first paragraph of 11.1.3.2.1 as follows:

STAs when dot11InterworkingServiceActivated is true subject to criteria below, receiving Probe Request frames containing an Interworking field in the Extended Capabilities information element set to 1 shall respond with a Probe Response only if:

a) The SSID in the Probe Request is the wildcard SSID, the SSID in the Probe Request is the specific SSID of the STA, or the specific SSID of the STA is included in the SSID list element,

b) The BSSID field in the Probe Request is the wildcard BSSID or the BSSID of the STA, ~~and~~

c) The DA field in the Probe Request is the broadcast address or the specific MAC address of the STA,

d) the HESSID field, if present in the Interworking element, is the wildcard HESSID or the HESSID of the STA, and

e) the Access Network Type field in the Interworking element is the wildcard Access Network Type or the Access Network Type of the STA.

11.3 STA authentication and association

11.3.2 Association, reassociation, and disassociation

11.3.2.1 STA association procedures

Insert the following new list item (a1) after item a) in the lettered list after the first paragraph in 11.3.2.1:

a1) If dot11InterworkingServiceActivated is true and the STA does not have credentials for the AP, and the STA is initiating an emergency services association procedure, it includes the Interworking element with the UESA field set to 1.

11.3.2.2 AP association procedures

Insert the following new list item (a1) after item a) in the lettered list after the first paragraph in 11.3.2.2:

a1) At an AP having dot11InterworkingServiceActivated set to true, subsequent to receiving an Association Request frame that includes the Interworking element with UESA field set to 1 and does not include an RSN element, then upon receipt of an MLME-ASSOCIATE.response service primitive, the AP shall accept the association request even if dot11RSNAEnabled is set true and dot11PrivacyInvoked is true thereby granting access, using unprotected frames (see 7.1.3.1.8), to the network for emergency services purposes.

11.3.2.3 STA reassociation procedures

Insert the following new list item (b1) after item b) in the lettered list after the first paragraph in 11.3.2.3:

b1) If dot11InterworkingServiceActivated is true and the STA was associated to the ESS for unsecured access to emergency services, it includes the Interworking element with the UESA field set to 1 in the MLME-REASSOCIATE.request primitive.

11.3.2.4 AP reassociation procedures

Insert the following new list item (a1) after item a) in the lettered list after the first paragraph in 11.3.2.4:

a1) At an AP having dot11InterworkingServiceActivated set to true, subsequent to receiving a Reassociation Request frame that includes the Interworking element with UESA field set to 1 and does not include an RSN element, then upon receipt of an MLME-REASSOCIATE.response service primitive, the AP shall accept the reassociation request even if dot11RSNAEnabled is set true and dot11PrivacyInvoked is true thereby granting access, using unprotected frames (see 7.1.3.1.8), to the network for emergency services purposes.

11.4 TS Operation

11.4.1 Introduction

Insert the following new paragraph after the second paragraph of 11.4.1:

TS may have zero or one Expedited Bandwidth Request (EBR) element associated with it. An AP uses the parameters in the EBR to understand the precedence level requested by a non-AP STA (see X.4.3). For example, the precedence level may be used to convey to the AP that the requested TS is for the purposes of placing an emergency call. Support for precedence levels greater than 18 is optional for STAs.

Change the now fourth paragraph of 11.4.1 as shown:

TSPEC, ~~and~~ the optional TCLAS elements, and the optional EBR element are transported on the air by the ADDTS, in the corresponding QoS frame and across the MLME SAP by the MLME-ADDTS primitives. In addition, a TS could be created if a STA sends a resource request to an AP prior to initiating a transition to that AP or in the Reassociation Request frame to that AP.

Insert the following paragraph at the end of 11.4.1:

When dot11SSPNInterfaceActivated is true, TSPEC processing by the HC may be subject to limitations received from the SSPN interface. The SSPN may limit access to certain QoS priorities, and further restrict the data rate and delay used with any priority.

11.4.3 TS lifecycle

Change the fifth paragraph of 11.4.3 as follows:

An active TS becomes inactive following a TS deletion process initiated at either non-AP STA or HC. It also becomes inactive following a TS timeout detected at the HC, or if the HC within an AP when dot11SSPNInterfaceActivated is true determines as defined in 11.23.5 that the non-AP STA's TS has exceeded the transmitted MSDU limit for the access category in which the TS was admitted. When an active TS becomes inactive, all the resources allocated for the TS are released.

11.4.4 TS setup

Change the fifth paragraph of 11.4.4 as follows:

The SME in the HC decides whether to admit the TSPEC as specified, refuse the TSPEC, or not admit but suggest an alternative TSPEC. If the TSPEC is received from a non-AP STA by an AP when dot11SSPNInterfaceActivated is true, the HC shall use the permissions stored in dot11InterworkingEntry for that STA in the decision to admit or deny the request (see 11.23.5.3). The SME then generates an MLME-ADDTS.response primitive containing the TSPEC and a ResultCode value. The contents of the TSPEC and Status fields contain values specified in 10.3.24.4.2.

Insert the following new paragraph and lettered list after the fifth paragraph of 11.4.4 as follows:

When the HC in an AP that has its dot11SSPNInterfaceActivated set to TRUE receives a TSPEC, the AP shall inspect it to determine the requested access policy, user priority and mean datarate.

a) The access category shall be determined from the user priority according to Table 9-1. For a TS to be admitted when the requested access policy is set to EDCA, both of the following shall be true:
    i) The field corresponding to this access category in dot11NonAPStationAuthAccessCategories from the non-AP STA's dot11InterworkingEntry is equal to 1.
    ii) The sum of the mean data rate of all the requesting STA's active TSs in this access category plus the mean data rate in the TSPEC is less than or equal to the non-AP STA's dot11InterworkingEntry for dot11NonAPStationAuthMaxVoiceRate, dot11NonAPStation-AuthMaxVideoRate, dot11NonAPStationAuthMaxBestEffortRate, or dot11NonAPStation-AuthMaxBackgroundRate depending on whether the derived access category is AC_VO, AC_VI, AC_BE or AC_BK, respectively.
b) For a TS to be admitted when the requested access policy is set to HCCA, all of the following shall be true:
    i) The dot11NonAPStationAuthHCCAHEMM value is true.

ii) The sum of the mean data rate of all the requesting STA's active TSs having access policy set to HCCA plus the mean data rate in the TSPEC is less than or equal to dot11NonAPStationAuthMaxHCCAHEMMRate in the non-AP STA's dot11InterworkingEntry.

iii) The delay bound that will be provided by the HC in the TSPEC response is less than or equal to dot11NonAPStationAuthHCCAHEMMDelay in the non-AP STA's dot11InterworkingEntry.

Change the now seventh paragraph of 11.4.4 as follows:

The HC MAC transmits an ADDTS Response frame containing this TSPEC and status. The encoding of the ResultCode values to Status Code field values is defined in Table 11-2. In an AP when dot11SSPNInterfaceActivated is true, the HC shall set the dot11NonAPStationAddtsResultCode in the non-AP STA's dot11InterworkingEntry equal to the ResultCode.

Insert status codes 0, 38, 39, 47, 64, and 67 into Table 11-2 as shown (note that the entire table is not shown):

Table 11-2—Encoding of ResultCode to Status Code field value

ResultCode	Status code
SUCCESS	0
INVALID_PARAMETERS	38
REJECTED_WITH_SUGGESTED_CHANGES	39
REJECTED_FOR_DELAY_PERIOD	47
REJECTED_HOME_WITH_SUGGESTED_CHANGES	64
REJECTED_FOR_SSP_PERMISSIONS	67

Insert the following text as the last paragraph of 11.4.4:

When a STA requests service at a higher priority than authorized by its dot11InterworkingTableEntry, the HC may optionally provide a suggested TSPEC with a data rate and lower priority that would be authorized. Usage of the TSPEC in an Interworking environment is described in Annex K (Admission Control).

11.7 DLS operation

11.7.1.2 Setup procedure at the AP

Change the second paragraph of 11.7.1.2 as indicated:

Upon receipt of the DLS Request frame (step 1a in Figure 11-15), the AP shall

— Send DLS Response frame to the STA that sent the DLS Request frame with a result code of Not Allowed in the BSS, if direct links are not allowed in the BSS (step 2b in Figure 11-15), or for the AP with dot11SSPNInterfaceActivated set to TRUE with a result code of Not Allowed by SSP if the dot11NonAPStationAuthDls MIB variable in either of the non-AP STA's dot11InterworkingTable is false.

Insert the following subclauses (11.23 through 11.23.9) after 11.22:

11.23 WLAN interworking with external networks procedures

11.23.1 General

This subclause describes the actions and the procedures that provide interworking capabilities between IEEE 802.11 infrastructure and external networks.

11.23.2 Interworking capabilities and information

STAs indicate their support for interworking service by setting the dot11InterworkingServiceActivated MIB variable to true. When dot11InterworkingServiceActivated is true, STAs include the Interworking element in Beacon and Probe Response frames and non-AP STAs include the Interworking element in Probe Request frames.

When dot11InterworkingServiceActivated and dot11ExtendedChannelSwitchEnabled are both set to TRUE, the AP may provide its operating channel and regulatory class to an Interworked SSPN using the values from dot11RegulatoryClassesTable MIB entry.

The Interworking element contains signaling for Homogeneous ESSs. The HESSID is a 6-octet MAC address that identifies the homogeneous ESS. The HESSID value shall be identical to one of the BSSIDs in the homogeneous ESS. Thus, it is a globally unique identifier that in conjunction with the SSID, may be used to provide network identification for an SSPN.

NOTE—It is required by this standard that the HESSID field in the Interworking element is administered consistently across all BSSs in a homogeneous ESS.

The Interworking element also provides an Access Network Type in Beacon and Probe Response frames to assist the non-AP STA with network discovery and selection.

11.23.3 Interworking procedures: generic advertisement service (GAS)

This subclause describes the actions and procedures that are used to invoke GAS. GAS may be used to enable network selection for STAs when dot11InterworkingServiceActivated is true. GAS provides transport mechanisms for advertisement services while STAs are in the unassociated state as well as the associated state. This is accomplished via the use of Public Action management frames, which are Class-1 frames. GAS messages shall be transmitted using individually addressed Public Action frames. When Management Frame Protection is negotiated, stations shall use individually addressed Protected Dual of Public Action frames instead of individually addressed Public Action frames.

A GAS message exchange may take place between two STAs; one STA transmits a GAS Query Request and the other STA transmits the GAS Query Response as described in 11.23.3.1. The Advertisement Protocol transported by the GAS is one of the query protocols in Table 7-43bi.

GAS shall be supported by a STA when dot11InterworkingServiceActivated is true. ANQP shall be supported by a STA when dot11InterworkingServiceActivated is true. Other advertisement protocols shall be supported when the corresponding dot11GASAdvertisementID is present.

STAs shall not transmit a GAS Query for any Advertisement Protocol unless that Advertisement Protocol ID is included in the Advertisement Protocol element in a Beacon or Probe response frame. The Advertisement Protocol element specifies the Advertisement Protocols that a STA may use to communicate with Advertisement Servers, which may be co-located with a STA or in an external network. The Advertisement Protocol identifies the query language used by the Advertisement Server. The GAS protocol, which is used to transport Queries and Query Responses, is transparent to the Advertisement Protocol.

11.23.3.1 GAS Protocol

Presence of the Interworking element in Beacon or Probe Response frames indicates support for the GAS protocol. Presence of the Advertisement Protocol element in Beacon or Probe Response frames indicates the Advertisement Protocol IDs supported in the BSS or IBSS. A STA transmits a GAS Query using a GAS Initial Request frame and the responding STA provides the query response or information on how to receive the query response in a GAS Initial Response frame. The GAS Query Response shall be delivered in a single GAS Initial Response frame or in one or more GAS Comeback Response frames; the GAS Query Response shall not be split between a GAS Initial Response frame and one or more GAS Comeback Response frames. The GAS message sequence diagrams are shown in Figure 11-24, Figure 11-25, and Figure 11-26.

Figure 11-24 describes the GAS message exchange sequence when dot11GASPauseForServerResponse is true and the GAS Query Response fits within one MMPDU.

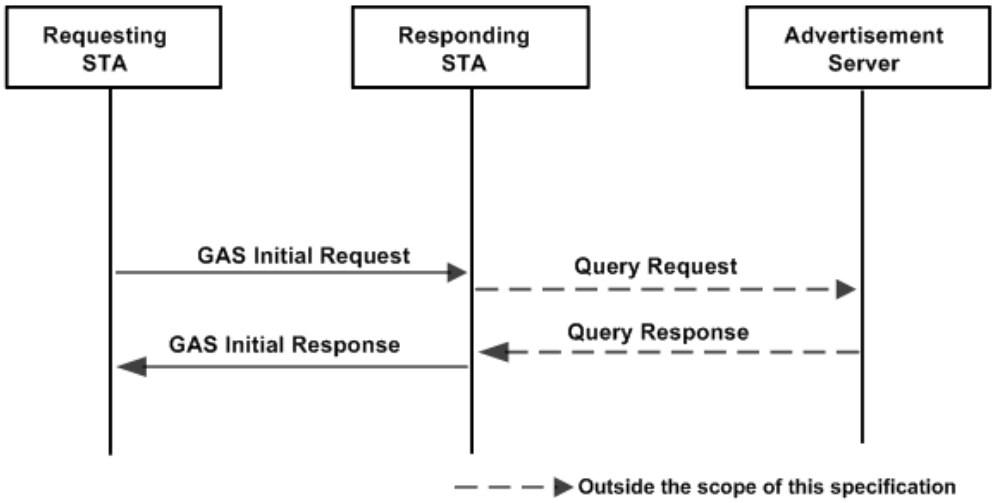


Figure 11-24—GAS message sequence with dot11GASPauseForServerResponse set to true

Figure 11-25 describes the GAS message exchange sequence when dot11GASPauseForServerResponse is true and the GAS Query Response is too large to fit in one MMPDU and GAS fragmentation is used for delivery. The number of GAS Comeback Request and GAS Comeback Response messages depends on the number of GAS fragments required for delivery of the GAS Query Response.

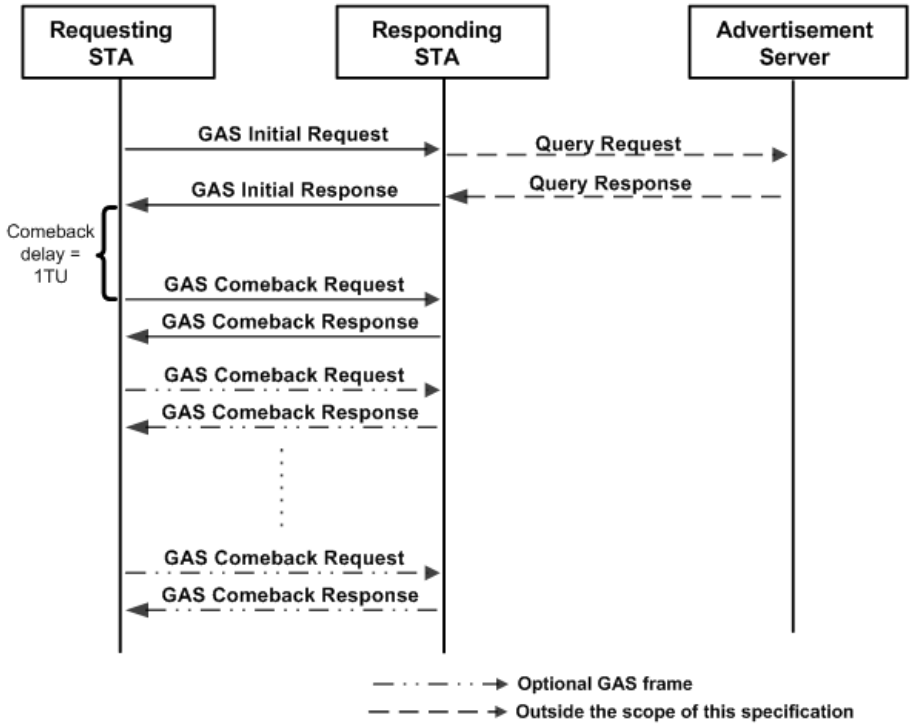

Figure 11-25—GAS message sequence with GAS fragmentation and dot11GASPauseForServerResponse set to true

Figure 11-26 describes the GAS message exchange sequence when dot11GASPauseForServerResponse is false. The number of GAS Comeback Request and GAS Comeback Response messages depends on the number of GAS fragments required for delivery of the GAS Query Response.

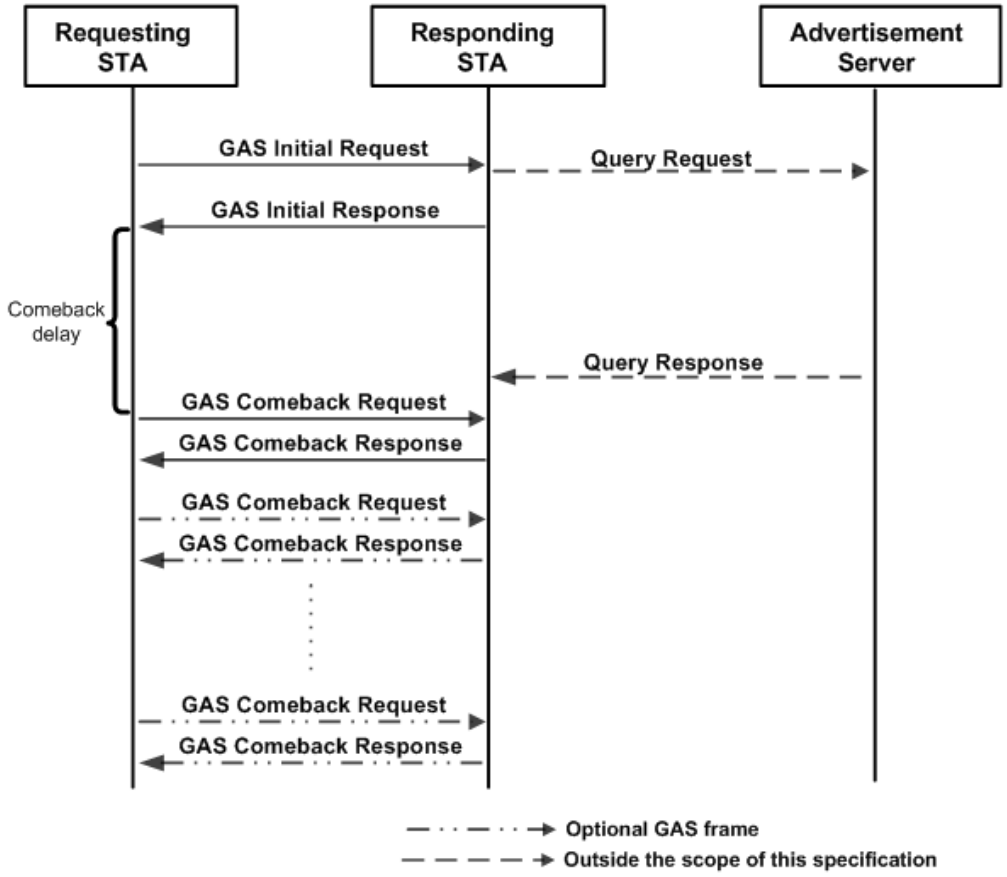

Figure 11-26—GAS message sequence with GAS fragmentation and dot11GASPauseForServerResponse set to false

11.23.3.1.1 STA procedures to transmit a GAS Query

Upon receipt of an MLME-GAS.request primitive, the requesting STA shall engage in the following procedure to transmit a query:

a) The requesting STA sends a GAS Query by transmitting a GAS Initial Request frame containing a Dialog Token, an Advertisement Protocol element containing an Advertisement Protocol ID and the GAS Query in the Query Request field.

b) Upon transmission of the GAS Initial Request frame, the STA shall set a timer, referred to as the dot11GASResponseTimer, equal to the dot11GASResponseTimeout MIB object or the QueryFailureTimeout parameter provided in the MLME-GAS.request primitive. If both values are present, the timer shall be set to the lesser of the two values.

c) If the requesting STA is not in the associated state, it shall remain in active mode until the receipt of a GAS Initial Response frame with the same Dialog Token as in the GAS Initial Request frame or until the expiry of the timer, whichever occurs first. If the requesting STA is in the associated state,

it may go into power save state until the GAS Initial Response frame is available for receipt or the timer expiry, whichever occurs first.

d) If the dot11GASResponseTimer expires before a GAS Initial Response frame is received, the GAS Query was not successful and the MLME shall issue an MLME-GAS.confirm primitive indicating "timeout" and shall set the Query Response Length field to 0.

11.23.3.1.2 STA procedures to post a GAS Query to an Advertisement Server

Upon receipt of a GAS Initial Request frame, an MLME-GAS.indication primitive shall be issued to the STA's SME. Upon receipt of an MLME-GAS.response primitive, the STA shall transmit a GAS Initial Response frame to the requesting STA according to the following procedures. If the requesting STA is in the associated state and in the power-save mode, the responding STA shall buffer the frame for transmission according to the procedures in 11.2.1; otherwise the STA shall queue the frame for transmission.

a) If the Advertisement Protocol ID in the Advertisement Protocol element does not equal the value contained in any dot11GASAdvertisementID MIB object, then the STA shall not post the query to an Advertisement Server. The STA shall transmit a directed GAS Initial Response frame to the requesting STA containing a dialog token whose value is identical to the dialog token in the GAS Initial Request frame, a Status Code equal to "GAS Advertisement Protocol not supported" (see Table 11-14), an Advertisement Protocol element containing the Advertisement Protocol ID used in the GAS Initial Request frame and a Comeback Delay and Query Response Length both set to 0.

Table 11-14—GAS MLME primitive's encoding of Result Code to Status Code field

Status code	ResultCode
59	ADVERTISEMENT_PROTOCOL_NOT_SUPPORTED
60	NO_OUTSTANDING_REQUEST
61	RESPONSE_NOT_RECEIVED_FROM _SERVER
62	TIMEOUT
63	QUERY_RESPONSE_TOO_LARGE
65	SERVER_UNREACHABLE
79	TRANSMISSION_FAILURE

b) If the query request corresponds to an Advertisement Protocol whose server is currently unreachable, the responding STA shall transmit a directed GAS Initial Response frame to the requesting STA containing a dialog token whose value is identical to the dialog token in the GAS Initial Request frame, a Status Code equal to "Advertisement Server in the network is not currently reachable," an Advertisement Protocol element containing an Advertisement Protocol ID equal to the Advertisement Protocol ID contained in the GAS Initial Request frame and a Comeback Delay and Query Response Length both set to 0. The method used by the AP to determine the server is unreachable is out of scope of this specification. A STA receiving a status code indicating the Advertisement Server is unreachable should wait at least 1 minute before transmitting any further queries using the same Advertisement Protocol ID to the responding STA.

c) If the Advertisement Protocol ID in the Advertisement Protocol element equals the value contained in any dot11GASAdvertisementID MIB object, then the STA shall initialize a timer, referred to as the PostReplyTimer, to the value in dot11GASResponseTimeout MIB object and post the query to

the Advertisement Server identified by the Advertisement Protocol ID. The methods and protocols the STA uses to post the query are outside the scope of this specification.

d) If dot11GASPauseForServerResponse is false, the responding STA shall transmit an individually addressed GAS Initial Response frame to the requesting STA containing a dialog token whose value is identical to the dialog token in the GAS Initial Request frame, a Status Code set to "success," an Advertisement Protocol element containing the Advertisement Protocol ID used in the GAS Initial Request frame, a GAS Comeback Delay set to the value in dot11GASComebackDelay for this Advertisement Protocol and a Query Response Length set to 0.

e) If dot11GASPauseForServerResponse is true, the GAS Query Response is delivered as defined in 11.23.3.1.3.

11.23.3.1.3 STA procedures for transmitting the GAS Query Response

After receiving a query response from the Advertisement Server, the responding STA shall buffer the query response for a minimum of dot11GASResponseBufferingTime after the expiry of the GAS Comeback Delay or until the query response is delivered. If the responding STA does not receive a GAS Comeback Request frame whose source MAC address and Dialog Token match the source MAC address and Dialog Token respectively of the corresponding GAS Initial Response frame within this time, it may drop the query response. If the query response is larger than the configured Query Response Length Limit, the responding STA shall discard the response and instead return a status code of "GAS Query Response larger than query response length limit" in the GAS Comeback Response frame. This behavior helps to prevent abuses of the medium that may be caused by overly general queries, which evoke a very large query response.

The GAS protocol supports Query Responses whose length is greater than the IEEE 802.11 maximum MMPDU size by the STA's use of the GAS Query Response Fragment ID field in the GAS Comeback Response frame; the Query Response Fragment ID shall be set to 0 for the initial fragment and incremented by 1 for each subsequent fragment in a multi-fragment query response. If the Query Response is a multi-fragment response (i.e., contains more than 1 fragment), the STA shall transmit all fragments that belong to the same Query Response until all fragments are exhausted. The STA shall set the More GAS Fragments field of the GAS Query Response Fragment ID to 0 when the transmitted fragment is the final fragment.

The following procedures shall be used by the responding STA to deliver the query response to the requesting STA.

a) If dot11GASPauseForServerResponse is true:

   1) If the PostReplyTimer expires before the GAS Query Response is received from the Advertisement Server, then the responding STA shall transmit an individually addressed GAS Initial Response frame to the requesting STA containing a dialog token whose value is identical to the dialog token in the GAS Initial Request frame, a Status Code set to "Timeout" (see Table 11-14), an Advertisement Protocol element containing the Advertisement Protocol ID used in the GAS Initial Request frame, a GAS Comeback Delay set to 0 and a Query Response Length set to 0. If the query response is subsequently received from the Advertisement Server, it shall be dropped by the responding STA.

   2) If the Query Response received from the Advertisement Server is larger than dot11GASQueryResponseLengthLimit or requires more than 128 fragments for transmission to the requesting STA, it shall be dropped by the responding STA. Then the responding STA shall transmit an individually addressed GAS Initial Response frame to the requesting STA containing a dialog token whose value is identical to the dialog token in the GAS Initial Request frame, a Status Code set to "Query Response too large" (see Table 11-14), an Advertisement Protocol element containing the Advertisement Protocol ID used in the GAS Initial Request frame, a GAS Comeback Delay set to 0 and a Query Response Length set to 0.

   3) If the query response's length is equal to or less than the maximum MMPDU size, the STA shall transmit an individually addressed GAS Initial Response frame to the requesting STA

containing a dialog token whose value is identical to the dialog token in the GAS Initial Request frame, a Status Code set to "success," an Advertisement Protocol element containing the Advertisement Protocol ID used in the GAS Initial Request frame, a GAS Comeback Delay set to 0, the Query Response and a Query Response Length set to the query response length. This completes the GAS Query and GAS Query Response exchange.

4) If the query response's length is larger than the maximum MMPDU size, the responding STA shall transmit an individually addressed GAS Initial Response frame to the requesting STA containing a dialog token whose value is identical to the dialog token in the GAS Initial Request frame, a Status Code set to "success," an Advertisement Protocol element containing the Advertisement Protocol ID used in the GAS Initial Request frame, a GAS Comeback Delay set to 1 TU, and a Query Response Length set to 0; this indicates the query response will be transmitted using GAS Comeback Request and Response frames that support GAS fragmentation as follows.

b) If dot11GASPauseForServerResponse is false:

1) If the PostReplyTimer expires before the GAS Query Response is received from the Advertisement Server then the responding STA shall buffer for transmission a GAS Comeback Response frame with a status code equal to "Timeout" (see Table 11-14). If the query response is subsequently received from the Advertisement Server, it shall be dropped by the STA.

2) If the Query Response received from the Advertisement Server is larger than dot11GASQueryResponseLengthLimit, it shall be dropped by the responding STA. Then the STA shall buffer for transmission a GAS Comeback Response frame with status code set to "Query Response too large."

c) If the Query Response is received before the expiry of the PostReplyTimer and its length is less than dot11GASQueryResponseLengthLimit, then the Query Response shall be buffered in one or more GAS Comeback Response frames with status code set to "success." The responding STA transmits one GAS Comeback Response frame in response to each GAS Comeback Request frame. If the Query Response received from the Advertisement Server is less than or equal to the maximum MMPDU payload size, then the GAS Query Response Fragment ID shall be set to zero and the More GAS Fragments field in the GAS Query Response Fragment ID shall be set to zero. If the Query Response received from the Advertisement Server is greater than the maximum MMPDU payload size, then the GAS Query Response Fragment ID shall be set to zero if this is the first fragment of the Query Response transmitted, otherwise it shall be incremented by 1; the More GAS Fragments field in the GAS Query Response Fragment ID shall be set to one if there are more fragments of the Query Response to be transmitted, otherwise it shall be set to zero (i.e., this fragment is the last fragment of the Query Response).

d) If a responding STA receives a GAS Comeback Request frame whose source MAC address and Dialog Token match the destination MAC address and Dialog Token respectively of an outstanding GAS Initial Response frame and the query response has not been received from the Advertisement Server and the PostReplyTimer has not expired, the responding STA shall transmit a GAS Comeback Response frame with status equal to "Response not received from server" (see Table 11-14) and GAS Comeback Delay set to the value in dot11GasComebackDelay for this Advertisement Protocol to indicate when the requesting STA should comeback to obtain its Query Response.

e) If a responding STA receives a GAS Comeback Request frame whose source MAC address and Dialog Token do not match the destination MAC address and Dialog Token respectively of an outstanding GAS Initial Response frame, the STA should transmit a GAS Comeback Response frame with a status code equal to "No request outstanding."

A requesting STA shall transmit a GAS Comeback Request frame including the Dialog Token (drawn from the corresponding GAS Initial Response frame) immediately after the expiry of the GAS Comeback Delay. In response, the responding STA provides the Query Response in one or more GAS Comeback Response frames with the corresponding Dialog Token.

If a requesting STA receives a GAS Comeback Response frame with status set to "Query response outstanding," the requesting STA shall wait for the GAS Comeback Delay from that frame and upon expiry of the GAS Comeback Delay, transmit another GAS Comeback Request frame. If the requesting STA's dot11GASResponseTimer (set in 11.23.3.1.1 step b) expires prior to receiving a GAS Comeback Response frame whose source MAC address and Dialog Token match those in the corresponding GAS Initial Response frame, the STA shall issue an MLME-GAS.confirm primitive with result code set to "timeout" and shall set the Query Response Length to 0.

If a requesting STA receives a GAS Comeback Response frame with status set to "success" and the More GAS Fragments field in the GAS Query Response Fragment ID set to one, it shall transmit another GAS Comeback Request frame in order to retrieve the next GAS fragment of a multi-fragment query response.

If a requesting STA receives a GAS Comeback Response frame with status set to "success" and the More GAS Fragments field in the GAS Query Response Fragment ID set to zero, the requesting STA's MLME shall determine that all fragments have been received by confirming that all fragment IDs from 0 to the value in the GAS Query Response Fragment ID when the More GAS Fragments field was set to 0 have been received. Upon receipt of the first GAS Comeback Response frame and every GAS Comeback Response frame thereafter, the dot11GASResponseTimer shall be reset. If all of the query response fragments were received before the expiry of the dot11GASResponseTimer, then the MLME shall issue an MLME-GAS.confirm with result code set to "success" along with the query response. If all of the query response fragments were not received before the expiry of the dot11GASResponseTimer, then the MLME shall issue an MLME-GAS.confirm with result code set to "transmission failure" and shall set the Query Response Length to 0.

After a requesting STA receives the first GAS fragment of a multi-fragment query response, it shall continue retrieving the query response until all GAS fragments are received or until a transmission failure is detected; the requesting STA shall not commence the retrieval of a another GAS Query Response from the same STA until all GAS fragments are received or until a transmission failure is detected on the first GAS Query Response.

If a requesting STA receives a GAS Comeback Response with status set to "Timeout" or "Query Response too large," then the MLME shall issue an MLME-GAS.confirm with result code so indicating and shall set the Query Response Length to 0.

If a requesting STA receives a GAS Comeback Response with status set to "No outstanding GAS request," then the MLME shall issue an MLME-GAS.confirm with result code set to "unspecified failure" and shall set the Query Response Length to 0.

11.23.3.1.4 GAS procedures interaction with Multiple BSSID Set

Non-AP STAs in the unassociated state may use GAS procedures to query Advertisement Servers for information. As described in 11.23.3.1, APs indicate their support for a particular GAS Advertisement Protocol by including an Advertisement protocol element with that Advertisement protocol ID in Beacon and Probe Response frames as described in 7.2.3.1 and 7.2.3.9 respectively. Non-AP STAs receiving Beacon or Probe Response frames from different APs may choose to engage in GAS frame exchange sequences with one or more of these APs. In some deployment scenarios, these APs may be operating as a Multiple BSSID set (as defined in 11.10.11) and may relay the GAS queries to the same Advertisement Server. Depending on the configuration of the IEEE 802.11 access network, the external network and the Advertisement Server, a query response from the Advertisement Server may or may not be dependent on the BSSID used in the GAS frame exchange sequence and thus the STA from which the query was relayed. If the GAS Query Response is dependent on the BSSID, a requesting STA may choose to post queries using GAS procedures to more than one STA and expect possibly different Query Responses. If the Query Response is not dependent on the BSSID, then a requesting STA may choose to post queries using GAS procedures to only one STA in the Multiple BSSID set (i.e., posting the same query to another member of the Multiple BSSID set would yield the same response).

When a Multiple BSSID (as defined in 11.10.11) set contains two or more members and dot11InterworkingServiceActivated is true and dot11GASAdvertisementID is present and a query to the Advertisement Server corresponding to the value of dot11GASAdvertisementID is not dependent on the BSSID value used in the GAS frame exchange sequence to post the query, then the PAME-BI bit in the Advertisement Protocol tuple of the Advertisement Protocol element corresponding to the value of dot11GASAdvertisementID shall be set to 1; otherwise this bit shall be set to zero.

11.23.3.2 ANQP procedures

A STA may use ANQP to retrieve information as defined in Table 7-43bk from a peer STA.

The ANQP Query Response is comprised of ANQP elements drawn from Table 7-43bk having an element type of S in Table 11-15 and shall be ordered by non-decreasing Info ID. The ANQP query response is transported in the Query Response field of GAS Response frames, as per 11.23.3.1.3. If information is not available for a particular ANQP element, then a query for that element will return that element with all optional fields not present.

ANQP frame usage for Infrastructure BSSs and IBSSs shall be in accordance with Table 11-15. Frame usage defines the entities permitted to transmit and receive particular ANQP elements. When dot11InterworkingServiceActivated is true, STAs shall be capable of using the ANQP Query list to request the ANQP Capability list and returning the ANQP Capability list in an ANQP GAS message exchange; support for all other ANQP elements is optional.

Table 11-15—ANQP usage

			BSS		IBSS
Info Name	**ANQP Info Element (clause)**	**Element Type**	**AP**	**Non-AP STA**	**STA**
ANQP Query list	7.3.4.1	S	T, R	T, R	T, R
ANQP Capability list	7.3.4.2	Q	T, R	T, R	T, R
Venue Name information	7.3.4.3	S	T	R	—
Emergency Call Number information	7.3.4.4	S	T	R	—
Network Authentication Type information	7.3.4.5	S	T	R	—
Roaming Consortium list	7.3.4.6	S	T	R	—
ANQP vendor-specific list	7.3.4.7	Q, S	T, R	T, R	T, R
IP Address Type Availability information	7.3.4.8	S	T, R	T, R	T, R
NAI Realm list	7.3.4.9	S	T	R	T, R
3GPP Cellular Network information	7.3.4.10	S	T	R	—
AP Geospatial Location	7.3.4.11	S	T	R	T, R
AP Civic Location	7.3.4.12	S	T	R	T, R

Table 11-15—ANQP usage *(continued)*

Info Name	ANQP Info Element (clause)	Element Type	BSS		IBSS
			AP	Non-AP STA	STA
The AP Location Public Identifier URI	7.3.4.13	S	T	R	T, R
Domain Name list	7.3.4.14	S	T	R	—
Emergency Alert Identifier URI	7.3.4.15	S	T	R	T, R
Emergency NAI	7.3.4.16	S	T	R	—

Symbols
Q element is an ANQP Query
S element is an ANQP Response
T ANQP element may be transmitted by MAC entity
R ANQP element may be received by MAC entity
— ANQP element is neither transmitted nor received by MAC entity

A STA that encounters an unknown or reserved ANQP Info ID value in a GAS frame (see Table 7-57f6) received without error shall ignore that ANQP Info ID and shall parse any remaining ANQP Info IDs.

A STA that encounters an unknown vendor-specific OI field or subfield in a GAS frame (see Table 7-57f6) received without error shall ignore that field or subfield respectively, and shall parse any remaining fields or subfields for additional information with recognizable field or subfield values.

11.23.3.2.1 ANQP Query list procedures

The ANQP Query list is used by a requesting STA to perform an ANQP Query using the procedures defined in 11.23.3.2. The requesting STA shall only include Info IDs in the ANQP Query list that have the sole element type of S as shown in Table 11-15. Info IDs that have an element type of Q shall not be included in the ANQP Query list (e.g., the Info ID for ANQP Vendor Specific list shall not be included).

A responding STA that encounters an unknown or reserved ANQP Info ID value in an ANQP Query list received without error shall ignore that ANQP Info ID and shall parse any remaining ANQP Info IDs.

11.23.3.2.2 Roaming Consortium list procedures

The Roaming Consortium list, which contains a set of OIs, can be retrieved from an AP by a non-AP STA using the GAS procedures defined in 11.23.3.1. The list of OIs included in the Roaming Consortium list shall be those OIs in the dot11RoamingConsortiumTable. An AP shall only include an OI in the dot11RoamingConsortiumTable, if in conjunction with an AS, it is capable of successfully authenticating a non-AP STA having valid security credentials for the SSPN identified by that OI. Methods used by the AP to authenticate the non-AP STA include, but are not limited to, RSNA algorithms and Open System authentication.

Each OI identifies an SSP or group of SSPs (i.e., a roaming consortium). An SSP or group of SSPs can register for and obtain an OI using the procedures defined in [B11a].

A non-AP STA can have a locally stored binding between an OI and a set of security credentials with which it can authenticate to the network identified by the OI, that is, the SSPN. The method by which this binding

is obtained is outside the scope of this standard. A non-AP STA can select from that list of credentials when authenticating to the BSS.

11.23.3.2.3 AP procedures for advertising EAP Method associated with an NAI Realm

When dot11RSNAEnabled is true, NAI realms along with their supported authentication methods may be advertised using the NAI Realm list (see 7.3.4.9). Each realm may be optionally associated with a set of EAP methods. Each EAP method may be optionally associated with a set of Authentication Parameters. The NAI realm information provides a hint on the methods a STA can use to establish an association in an RSN IEEE 802.1X environment. If the non-AP STA recognizes the NAI realm, it may attempt authentication even if it believes the EAP methods are incorrect.

When dot11RSNAEnabled is false and the Network Authentication Type (see 7.3.4.5) contains a Network Authentication Type Unit having a Network Authentication Type Indicator field set to http/https redirection or DNS redirection, NAI realms without supported authentication methods may be advertised using the NAI Realm list (see 7.3.4.9).

A non-AP STA having dot11InterworkingServiceActivated set to TRUE may process the NAI realm list. The selection of the NAI realm the non-AP STA uses for authentication is outside the scope of this standard. A non-AP STA requests the NAI Realm list using GAS procedures defined in 11.23.3.1.

A non-AP STA having dot11InterworkingServiceActivated set to TRUE may optionally process the EAP Method list as follows:

— The EAP Method list provided by the AP shall be in priority order (the most preferred EAP Method is listed first).

— The credential types help the STA to determine what credentials to use for authentication.

— The STA should confirm the GAS advertisement after an RSNA is established by performing a GAS Query for the NAI Realm list using Protected Dual of Public Action frames.

NOTE—The advertisements should be confirmed after the RSNA is established to avoid downgrade attacks.

The policy that determines whether a non-AP STA should attempt authentication and/or association with any particular IEEE 802.11 Access Network is outside the scope of this standard.

11.23.3.2.4 AP Geospatial Location procedures

A STA when dot11InterworkingServiceActivated is true may retrieve an AP's Geospatial location using GAS procedures in 11.23.3.1. A STA in the associated state should retrieve Geospatial location information from the AP using the procedures in 11.10.8.

11.23.3.2.5 AP Civic Location procedures

A STA when dot11InterworkingServiceActivated is true may retrieve an AP's Civic location using GAS procedures in 11.23.3.1. A STA in the associated state should retrieve Civic location information from the AP using the procedures in 11.10.8.

11.23.3.2.6 Emergency NAI procedures

A dot11InterworkingServiceActivated STA that does not have valid credentials to authenticate to a network can use the Emergency NAI string as its EAP identity.

The Emergency NAI string can be retrieved from the AP using the ANQP procedures in 11.23.3.2.

The STA uses the Emergency NAI to indicate its intention to access the network without peer authentication by using the Emergency NAI as its identity in the authentication process, as described in RFC5216.

11.23.4 Interworking procedures: IEEE 802.21 MIH support

IEEE Std 802.21-2008, the "MIH standard," supports handovers across heterogeneous networks. STAs with dot11InterworkingServiceActivated set to TRUE and having the dot11GasAdvertisementId MIB object set to MIH Information Service (see Table 7-43bi) shall support the transmission and reception of IEEE 802.21 MIIS queries for STAs in all states. STAs with dot11InterworkingServiceActivated set to TRUE and having a dot11GasAdvertisementId MIB object set to MIH Command and Event Services Capability Discovery (see Table 7-43bi) shall provide support for IEEE 802.21 MICS/MIES capability discovery for non-AP STAs in all states.

Additionally, support for IEEE 802.21 MIIS query and IEEE 802.21 MICS/MIES capability discovery to non-AP STA's in the associated state is provided by the STA forwarding IP datagrams destined for the MIH point of service to the IEEE 802.21 MIIS server.

A non-AP STA discovers support for these services by receiving Beacon or Probe Response frames with an Advertisement Protocol element having Advertisement Protocol ID(s) for MIH Information Service and/or IEEE 802.21 MICS/MIES capability discovery.

A non-AP STA forms an IEEE 802.21 IS query by creating its query request according to the procedures defined in IEEE Std 802.21-2008 and formatting that request into an IEEE 802.21 MIH protocol frame as defined in 8.4 of IEEE Std 802.21-2008. The non-AP STA, using the procedures in 11.23.3.1, posts the query to an IEEE 802.21 IS server by transmitting the MIH formatted frame in the Query request field of a GAS Initial Request frame. The Advertisement Protocol ID field in the GAS Initial Request frame is set to the value of IEEE 802.21 MIH Information Service (Table 7-43bl).

Non-AP STAs in the unauthenticated or unassociated or associated states can use GAS procedures to discover MIH Command and Event Services Capability as specified in Table 7-43bi.

A non-AP STA forms an IEEE 802.21 MIH Command and Event Service discovery request by encapsulating an MIH_Capability_Discover request (see IEEE 802.21-2008) into an MIH protocol frame as defined in 8.4 of IEEE Std 802.21-2008. The non-AP STA, using the procedures in 11.23.3.1, posts the discovery request to the network by transmitting the MIH formatted frame in the Query request field of a GAS Initial Request frame. The Advertisement Protocol ID field in the GAS Initial Request frame is set to the value of MIH Command and Event Services Capability Discovery (Table 7-43bi). The method by which the AP relays the discovery request to the network is defined in IEEE Std 802.21-2008 and is outside the scope of this specification.

A non-AP STA retrieves the IEEE 802.21 MIH Command and Event Service discovery response according to the procedures in 11.23.3.1. The discovery response is an MIH protocol frame as defined in 8.4 of IEEE Std 802.21-2008.

11.23.5 Interworking procedures: interactions with SSPN

11.23.5.1 General operation

To provide SSPN Interface services, the IEEE 802.11 network interacts with the SSPN corresponding to the user of the non-AP STA either directly or via a roaming relationship. As part of setting up the RSN security association, user policies are communicated to the AP. If dot11SSPNInterfaceActivated is true, these permissions shall be stored in the AP's dot11InterworkingTableEntry for that STA. Thereafter, the AP shall use the dot11InterworkingTableEntry for controlling the service provision to that non-AP STA. User policies from the SSPN affect authentication, authorization, and admission control decisions at the AP. In addition,

the AP collects statistics about the non-AP STA and reports the statistics to the SSPN when requested. The SSPN may also send service provision instructions to the AP, e.g., to terminate the connection to a non-AP STA. Non-AP STAs do not support the SSPN Interface.

Network deployments typically provide that the AP and the server in the SSPN have a trustworthy channel that can be used to exchange information, without exposure to or influence by any intermediate parties. The establishment of this secure connection between the IEEE 802.11 infrastructure and the SSPN is outside the scope of this standard.

11.23.5.2 Authentication and cipher suites selection with SSPN

When the non-AP STA initiates IEEE 802.1X authentication, the EAP messages are forwarded to the SSPN based on the home realm information provided by the non-AP STA. If the IEEE 802.11 infrastructure is unable to forward the EAP message, the AP when dot11SSPNInterfaceActivated is set to true shall disassociate the non-AP STA with Reason Code "Disassociated because lack of SSP roaming agreement to SSPN."

In addition to the EAP messages, the IEEE 802.11 infrastructure also provides extra information regarding the non-AP STA to the SSPN as defined in X.3.1, e.g., the Cipher Suite supported by non-AP STA, the location of the AP to which the non-AP STA is associated, etc. Such information may be used by the SSPN to make authentication and service provisioning decisions.

In the SSPN Interface Service, the SSPN uses more information than is carried over EAP to decide on the authentication result. The SSPN can reject a connection request if the cipher suites supported by non-AP STA does not meet its security requirements. In this situation, the SME of the AP when dot11SSPNInterfaceActivated is set to true shall invoke a disassociation procedure as defined in 11.3.2.7 by issuing the MLME-DISASSOCIATE.request primitive. The AP disassociates the corresponding non-AP STA with Reason Code "Requested service rejected because of SSPN cipher suite requirement."

The SSPN can reject the association request based on the location of the non-AP STA, e.g., if the non-AP STA is requesting association to an AP or associated to an AP located in a forbidden zone. In this situation, the SME of the AP when dot11SSPNInterfaceActivated is set to true shall invoke a disassociation procedure as defined in 11.3.2.7 by issuing the MLME-DISASSOCIATE.request primitive. The AP disassociates the corresponding non-AP STA with Reason Code "Requested service not authorized in this location."

11.23.5.3 Reporting and session control with SSPN

An AP with dot11SSPNInterfaceActivated set to TRUE shall create a dot11InterworkingEntry in its dot11InterworkingTable for each STA that successfully associates. Permissions received from the SSPN for each associated STA shall be populated into the table; if no permissions are received from the SSPN for a particular non-AP STA, then the default permissions or an AP's locally defined policy may be used for that STA's dot11InterworkingEntry. If the AP's local policy is more restrictive than an object's permission value received from the SSPN Interface, then the AP's local policy may be enforced instead.

In an AP when dot11SSPNInterfaceActivated is set to true, the following procedure occurs:

— The non-AP STA's state contained within the dot11InterworkingEntry shall be transmitted to the new AP after a successful transition. The state definition and the protocol used to transfer the state are beyond the scope of this standard. The new AP shall not forward any frames for that non-AP STA until it receives the dot11InterworkingEntry from the prior AP.

— After the state is successfully transmitted to the new AP, the dot11InterworkingEntry for that non-AP STA shall be deleted from the prior AP's dot11InterworkingTable.

An AP with dot11SSPNInterfaceActivated set to TRUE shall delete the dot11InterworkingEntry for a non-AP STA when it disassociates from the BSS.

An AP with dot11SSPNInterfaceActivated set to TRUE shall enforce the dot11InterworkingEntry limits for a particular non-AP STA by comparing the values of octet counters to authorized access limits:

— dot11NonAPStationVoiceOctetCount is compared to dot11NonAPStationAuthMaxVoiceOctets. When the value of the authorized maximum octet count is exceeded, if the ACM field for AC_VO is set to 1 then the HC shall delete all admitted TSs on this access category and deny all subsequent ADDTS request frames with TID set 6 or 7, or if the ACM field for AC_VO is set to 0 then the non-AP STA shall be disassociated using the MLME-DISASSOCIATE.request primitive with a reason code of "Disassociated because authorized access limit reached."

— dot11NonAPStationVideoOctetCount is compared to dot11NonAPStationAuthMaxVideoOctets. When the value of the authorized maximum octet count is exceeded, if the ACM field for AC_VI is set to 1 then the HC shall delete all admitted TSs on this access category and deny all subsequent ADDTS request frames with TID set 4 or 5, or if the ACM field for AC_VI is set to 0 then the non-AP STA shall be disassociated using the MLME-DISASSOCIATE.request primitive with a reason code of "Disassociated because authorized access limit reached."

— dot11NonAPStationBestEffortOctetCount is compared to dot11NonAPStationAuthMaxBestEffort-Octets. When the value of the authorized maximum octet count is exceeded, if the ACM field for AC_BE is set to 1 then the HC shall delete all admitted TSs on this access category and deny all subsequent ADDTS request frames with TID set 0 or 3, or if the ACM field for AC_BE is set to 0 then the non-AP STA shall be disassociated using the MLME-DISASSOCIATE.request primitive with a reason code of "Disassociated because authorized access limit reached."

— dot11NonAPStationBackgroundOctetCount is compared to dot11NonAPStationAuthMaxBack-groundOctets. When the value of the authorized maximum octet count is exceeded, if the ACM field for AC_BK is set to 1 then the HC shall delete all admitted TSs on this access category and deny all subsequent ADDTS request frames with TID set 1 or 2, or if the ACM field for AC_BK is set to 0 then the non-AP STA shall be disassociated using the MLME-DISASSOCIATE.request primitive with a reason code of "Disassociated because authorized access limit reached."

— dot11NonAPStationHCCAHEMMOctetCount is compared to dot11NonAPStationAuthMaxHCCA-HEMMOctets. When the value of the authorized maximum octet count is exceeded, then the HC shall delete all admitted TSs with access policy of HCCA or HEMM and deny all subsequent ADDTS request frames with access policy set to HCCA or HEMM.

— The sum of dot11NonAPStationVoiceOctetCount, dot11NonAPStationVideoOctetCount, dot11NonAPStationBestEffortOctetCount, dot11NonAPStationAuthMaxBackgroundOctets, and dot11NonAPStationHCCAHEMMOctetCount is compared to dot11NonAPStationAuthMaxTotal-Octets. When the value of the authorized maximum octet count is exceeded, the non-AP STA shall be disassociated using the MLME-DISASSOCIATE.request primitive with a reason code of "Disassociated because authorized access limit reached."

11.23.6 Interworking procedures: emergency services support

Emergency services support provides STAs with the ability to contact authorities in an emergency situation. The following procedures allow the STA to determine whether emergency services are supported by the AP, and whether unauthenticated emergency service access is allowed.

In an AP, when dot11ESNetwork is true, the network is dedicated and limited to accessing emergency services. When dot11ESNetwork is true, the access network type field in the Interworking element shall be set to the value for "Emergency services only network" (see Table 7-43bh). When dot11ESNetwork is false, the network is not limited to accessing emergency services, and the access network type field in the Interworking element shall be set to a value other than "Emergency services only network." See Table 11-16.

Table 11-16—ESR and UESA field settings

Description	ESR	UESA
It is unspecified whether emergency services are reachable.	0	0
Emergency services are only reachable for authenticated STAs.	1	0
Reserved	0	1
Emergency services are reachable for STAs.	1	1

When the AP is located in a regulatory domain that requires location capabilities, the ESR field shall only be set to 1 and the Network Type shall only be set to "Emergency services only network" (see Table 7-43bb), if location capability is enabled on the AP. In Beacon and Probe Response frames, location capability is advertised when the Civic Location or Geo Location field in the Extended Capabilities Element is set to 1.

11.23.7 Interworking procedures: emergency alert system (EAS) support

The EAS provides alerts, typically issued by authorities. The Interworking Procedures EAS support enables the alerts to be transmitted upon request from APs to non-AP STAs. Subsequent to advertisement in Beacon and Probe Response frames, a non-AP STA uses GAS queries to retrieve an EAS message from the network according to the following procedures.

When dot11EASActivated is true, EAS operation shall be supported. When EAS operation is not supported, dot11EASActivated shall be set to FALSE.

When the IEEE 802.11 infrastructure is informed of the availability of an EAS message (the mechanism by which is outside the scope of this standard), an AP with dot11EASActivated set to TRUE shall advertise the availability of the EAS message by including an Emergency Alert Identifier element (see 7.3.2.97) for that message in its Beacon and Probe Response frames. The AP shall include one instance of an Emergency Alert Identifier element in its Beacon and Probe Response frames for each active EAS Message. The Emergency Alert Identifier element provides an Alert Identifier Hash value, a unique indicator of the EAS Message of the alert to the non-AP STA. The Alert Identifier Hash value allows the non-AP STA to determine whether this is a new alert.

NOTE—The same value of hash will be computed by each AP in an ESS and by each AP in different ESSs. Thus a non-AP STA, which can download emergency alert messages when in a pre-associated state, can unambiguously determine that it has already downloaded the message, avoiding unnecessary duplicates.

When an EAS Message has expired (the mechanism by which is outside the scope of this standard), an AP with dot11EASActivated set to TRUE shall remove the corresponding instance of an Emergency Alert Identifier element from its Beacon and Probe Response frames.

The Alert Identifier Hash in the Emergency Alert Identifier element shall be computed using HMAC-SHA1-64 hash algorithm as shown in 7.3.2.97.

After receiving an Alert Identifier Hash value for an EAS Message that has not already been retrieved from the network, a non-AP STA having dot11EASActivated set to TRUE can retrieve the EAS message from the AP either:

— Using the procedures defined in 11.23.3.1, transmit the Alert Identifier Hash of the desired message in the Query request field of a GAS Initial Request frame. The Advertisement Protocol ID field in the GAS Initial Request frame is set to the value for EAS (see Table 7-43bi).

— The Query response is a message formatted in accordance with OASIS EDXL.

— Retrieve the EAS message using a URI formed by concatenating the Emergency Alert Server URI with the hexadecimal numerals of the Alert Identifier Hash converted to UTF-8 encoded characters and the ".xml" file extension. For example, if the Emergency Alert Server URI is http://eas.server.org and the Alert Identifier Hash is "0x1234567890abcdef,", then the URI would be http://eas.server.org/1234567890abcdef.xml (the mechanism by which the URI is retrieved is outside the scope of this standard). The XML file is formatted in accordance with OASIS EDXL. The non-AP STA retrieves the Emergency Alert Server URI (see 7.3.4.15) using an ANQP query according to the procedures in 11.23.3.2. This method is recommended for non-AP STAs in the associated state.

11.23.8 Interworking procedures: support for the advertisement of roaming consortiums

APs can assist non-AP STAs performing network discovery and selection through the advertisement of a Roaming Consortium information element. The Roaming Consortium Information element contains information identifying an SSP or group of SSPs (i.e., a roaming consortium) whose security credentials can be used to authenticate with the AP transmitting this element. An SSP or group of SSPs can register for and obtain an OI using the procedures defined in [B11a]. Note that a non-AP STA may also use GAS procedures defined in 11.23.3.2.2 to retrieve a Roaming Consortium list, which can contain more OIs than the Roaming Consortium information element.

APs having dot11InterworkingServiceActivated set to true and having one or more entries in the dot11RoamingConsortiumTable shall include the Roaming Consortium information element in Beacon and Probe response frames. APs shall only include an OI in the dot11RoamingConsortiumTable, if in conjunction with an AS, it is capable of successfully authenticating a non-AP STA having valid security credentials for the SSPN identified by that OI. Methods used by the AP to authenticate the non-AP STA include, but are not limited to, RSNA algorithms and Open System authentication.

A non-AP STA can have a locally stored binding between an OI and a set of security credentials with which it can authenticate to the network identified by the OI, that is, the SSPN. The method by which this binding is obtained is outside the scope of this standard. A non-AP STA can select from that list of credentials when authenticating to the BSS.

11.23.9 Interworking procedures: support for QoS mapping from external networks

Maintaining proper end-to-end QoS is an important factor when providing interworking service. This is because the external networks may employ different network-layer (Layer 3) QoS practices. For example, the use of a particular differentiated services code point (DSCP) for a given service may be different between different networks. To ensure the proper QoS over-the-air in the IEEE 802.11 infrastructure, the mapping from DSCP to UP for the corresponding network needs to be identified and made known to the STAs. If an inconsistent mapping is used then:

— Admission control at the AP may incorrectly reject a service request, because the non-AP STA used the incorrect UP.

— Non-AP STAs may use the incorrect value for User Priority in TSPEC and TCLAS elements.

— The user may be given a different QoS over the IEEE 802.11 network than expected, e.g., a lower QoS may be provided than the STA expected.

Therefore, APs with dot11QosMapActivated set to TRUE shall set the QoS Map field in the Extended Capabilities information element to 1; APs with dot11QosMapActivated set to FALSE shall set the QoS Map field in the Extended Capabilities information element to 0. The AP's SME causes the QoS Map Set to be available to higher layer protocols or applications so they will be able to set the correct priority in an MA-UNITDATA.request primitive.

For frames transmitted by an AP belonging to an admitted TS, the UP obtained from the TS's TCLAS element shall be used instead of the UP derived from the QoS Map Set. For frames transmitted by an AP belonging to an admitted TS not having a TCLAS element, the UP shall be derived from the QoS Map Set.

Non-AP STAs when dot11QosMapActivated is set to true shall set the QoS Map field in the Extended Capabilities information element to 1. An AP receiving an Association request frame or Reassociation Request frame when the QoS Map field in the Extended Capabilities information element is set to 1 shall include the QoS Map Set element in the corresponding Association response frame or Reassociation response frame as defined in 7.2.3.5 or 7.2.3.7 respectively. Upon receiving the QoS Map Set element, the non-AP STA's SME causes the QoS Map Set to be available to higher layer protocols or applications so they will be able to set the correct priority in an MA-UNITDATA.request primitive.

When the AP's SME detects a change in the QoS mapping information, it shall update the non-AP STA with the new QoS Map Set element. It accomplishes this update by invoking the MLME-QoSMap.request primitive.

When the MAC entity at the non-AP STA receives a QoS Map Configure frame from the AP, the MLME shall issue an MLME-QoSMap.indication primitive to its SME.

When the non-AP STA's SME receives the QoS Map response, it shall make the QoS Map available to higher layers so that in turn, they can invoke the MA-UNITDATA.request with the correct priority.

11A Fast transition

11A.11 Resource request procedures

11A.11.2 Resource information container

Change the seventh paragraph of 11A.11.2 as follows:

For example, when the resource being requested is QoS for downstream traffic, a TSPEC information element~~s~~ may be followed by one or more TCLAS information elements and, when multiple TCLAS information elements are present, a TCLAS Processing element and an Expedited Bandwidth Request (EBR) element. Such an example Resource Request with two alternative TSPECs, the second of which has an EBR, is shown in Figure 11A-24.

Change the first row of Table 11A-2 as follows (note that the entire table is not shown here):

Table 11A-2—Resource types and resource descriptor definitions

Resource type	Resource description definition	Notes
802.11 QoS	In a request: TSPEC (see 7.3.2.30), followed by zero or more TCLAS (see 7.3.2.31), followed by zero or one TCLAS Processing (See 7.3.2.33). followed by zero or one Expedited Bandwidth Request elements (see 7.3.2.94). In a response: TSPEC (see 7.3.2.30), followed by zero or one Schedule (See 7.3.2.34)	May be sent by a QoS non-AP STA to a QoS AP. Definition of TSPEC information elements shall be as given in 11.4. Definition of TCLAS, TCLAS Processing, Expedited Bandwidth Request, and Schedule information elements, and the rules for including them in requests and responses, shall be as given in 11.4. Resource request procedures shall be as given in 11.4.

Replace Figure 11A-24 with the following figure:

Figure 11A-24—Resource Request example #2

RDIE	TSPEC	TCLAS	TCLAS	TCLAS Processing	TSPEC	TCLAS	TCLAS	TCLAS Processing	EBR

11A.11.3 Creation and handling of a resource request

11A.11.3.1 STA procedures

Change the fifth paragraph of 11A.11.3.1 as follows:

In generating the RDIE for QoS resources for a TS, the procedures of 11.4 shall be followed for the generation of TSPECs and inclusion of TCLAS, ~~and~~ TCLAS Processing, and Expedited Bandwidth Request elements. If the TS is a downstream flow, then the RDIE may also include one or more TCLAS element(s) (defined in 7.3.2.31), ~~and (if multiple TCLAS elements are included)~~ a TCLAS Processing element (defined in 7.3.2.33) if multiple TCLAS elements are included, and an optional Expedited Bandwidth Request (EBR) element, defined in 7.3.2.94. If present, the TCLAS shall appear after the corresponding TSPEC. If present, an EBR element shall appear after the corresponding TSPEC, TCLAS, and TCLAS Processing elements of the TSPEC.

11A.11.3.2 AP procedures

Change the sixth paragraph of 11A.11.3.2 as follows:

If the resource request included QoS resources and is successful, then the procedures for handling of TSPEC, TCLAS, ~~and~~ TCLAS Processing, ~~elements~~ and Expedited Bandwidth Request elements shall be as specified in 11.4, and the AP shall place the Traffic Streams into the "Accepted" state. The RIC-response shall contain the updated accepted TSPEC. Each RDIE may also include a Schedule information element (as defined in 7.3.2.34) after the accepted TSPEC. Upon reassociation, AP shall move all of the Traffic Streams from the "Accepted" state into the "Active" state.

Insert the new clause (Clause 11B) after Clause 11A as follows:

11B MAC state generic convergence function (MSGCF)

11B.1 Overview of the convergence function

This clause defines the MSGCF and its interaction with other management entities. The MSGCF correlates information exchanged between the MAC management entities regarding the state of an IEEE 802.11 interface and converges this information into events and status for consumption by higher layer protocols. Non-AP STAs when dot11MSGCFActivated is set to true shall support the MSGCF procedures in this clause; APs do not support the MSGCF.

This clause defines interactions between the MSGCF and MLME and PLME through the MLME_SAP and PLME_SAP respectively, as well as with the SME via the MSGCF-SME_SAP. The detailed manner in which the SAPs are implemented is not specified within this standard.

The MSGCF operates at the level of an IEEE 802.11 ESS, and generates events based on the state of the link between a non-AP STA and an ESS. A non-AP STA that transitions between two APs in the same ESS can operate transparently to the LLC sublayer, and will not change state in the state machine defined within this clause.

11B.2 Convergence function state machine

11B.2.1 Overview of state machine

The convergence function maintains information on the state of the ESS, using the state machine shown in Figure 11B.2.2. Because Figure 11B.2.2 is defined in terms of ESS connectivity, it is not affected by changes in association provided that the transition was an intra-ESS transition.

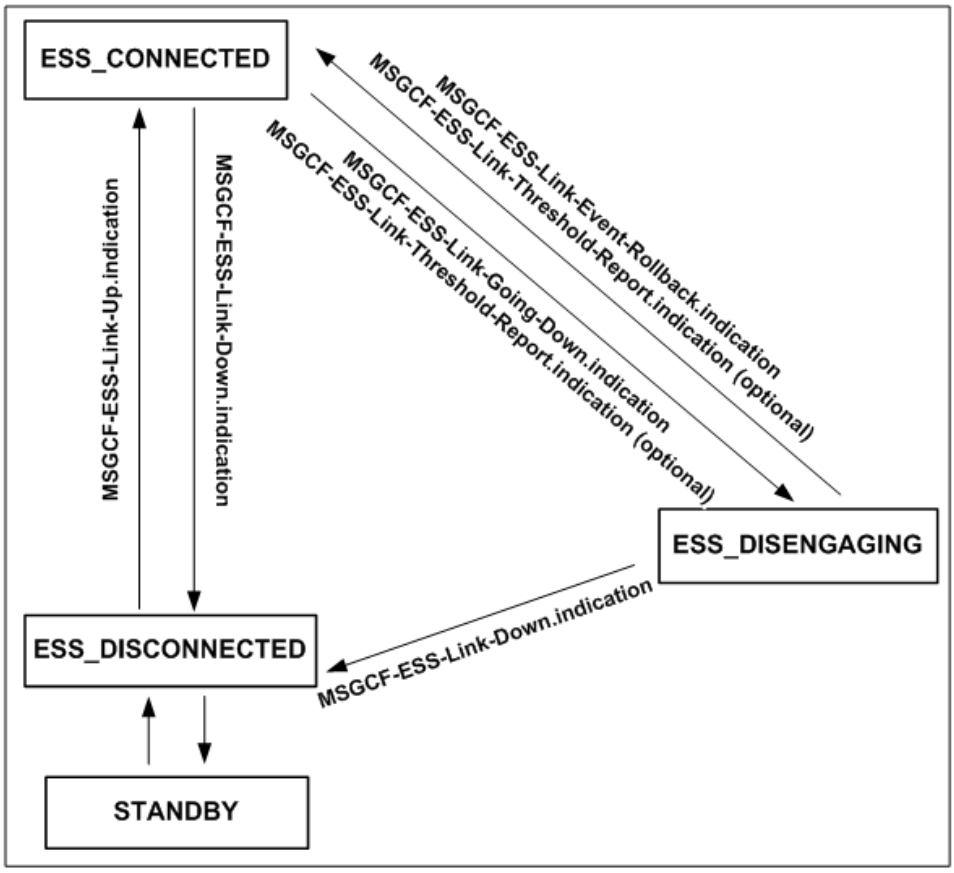

Figure 11B-1—MSGCF state machine

11B.2.2 State list

11B.2.2.1 ESS_CONNECTED

In the ESS_CONNECTED state, a non-AP STA has completed all layer 2 setup activities and is able to send Class 3 frames to peer LLC entities. A non-AP STA will be in this state as long as it is possible to send Class 3 frames through any AP within an ESS. A non-AP STA does not leave this state upon successful intra-ESS transitions.

11B.2.2.2 ESS_DISCONNECTED

In the ESS_DISCONNECTED state, a non-AP STA is unable to send Class 3 frames to peer LLC entities. Higher layer network protocols are unavailable. In this state, a non-AP STA may use GAS to perform network discovery and selection.

11B.2.2.3 ESS_DISENGAGING

In the ESS_DISENGAGING state, the non-AP STA's SME anticipates that links to all APs within the ESS will be lost in a defined time interval, but the non-AP STA is still able to send Class 3 frames to peer LLC entities. The predictive failure of the link may be due to explicit disassociation by the peer, the imminent invalidation of cryptographic keys because of usage limits (such as sequence counter exhaustion), or predictive signal strength algorithms. In this state, it is recommended that a non-AP STA also initiate a search to find a new ESS.

11B.2.2.4 STANDBY

In the STANDBY state, the non-AP STA is powered down and unable to communicate with any other IEEE 802.11 STAs.

11B.2.3 State transitions

11B.2.3.1 Transitions to ESS_CONNECTED

11B.2.3.1.1 From ESS_DISCONNECTED

To make this transition, a non-AP STA will have completed the network selection process and the relevant procedures to attach to the ESS, including IEEE 802.11 authentication, IEEE 802.11 association, and, if required, IEEE 802.11 RSN procedures. When this transition is completed, the MSGCF sends an MSGCF-ESS-Link-Up.indication primitive to higher layers.

11B.2.3.1.2 From ESS_DISENGAGING

To make this transition, the SME will cancel a previous event that predicted an ESS link failure. This may be due to network parameters indicating renewed link strength or a successful renewal of an expiring RSN SA. When this transition is complete, the MSGCF sends an MSGCF-ESS-Link-Event-Rollback.indication event to indicate that a prior link failure predictive event is no longer valid. If the transition was due to network parameters crossing a threshold, the MSGCF also issues an MSGCF-ESS-Link-Threshold-Report.indication to higher layers.

11B.2.3.2 Transitions to ESS_ DISCONNECTED

11B.2.3.2.1 From ESS_CONNECTED

This transition indicates that administrative action was taken to shut down the link, a sudden loss of signal strength or that RSN keys expired and could not be renewed. At the conclusion of this transition, the MSGCF issues an MSGCF-ESS-Link-Down.indication event to higher layer protocols.

11B.2.3.2.2 From ESS_DISENGAGING

This transition indicates that the predictive link failure event has occurred. At the conclusion of this transition, the MSGCF issues an MSGCF-ESS-Link-Down.indication event to higher layer protocols.

11B.2.3.2.3 From STANDBY

This transition occurs when the non-AP STA is powered on and initialized. No event is issued by the MSGCF.

11B.2.3.3 Transitions to ESS_DISENGAGING

11B.2.3.3.1 From ESS_CONNECTED

When the parameters as defined in Table 11B-6 change or imminent action is taken to bring down the link, the SME may predict an imminent link failure and initiate a transition. Upon completion of this transition, the MSGCF issues an MSGCF-ESS-Link-Going-Down event. If the cause of the transition was the degradation of network parameters beyond the thresholds stored in the MIB, an MSGCF-ESS-Link-Threshold-Report.indication is also issued to higher layers.

11B.2.3.4 Transitions to STANDBY

11B.2.3.4.1 From ESS_DISCONNECTED

When the non-AP STA has disconnected from an ESS, it may be administratively powered off to extend battery life. No events are issued by the MSGCF upon completion of this transition.

11B.3 Informational events

Informational events may occur in any state. When they occur, the SME updates the convergence function MIB with new parameters. Informational events do not cause state changes in Figure 11B.2.2. Informational events are generated when new potential ESS links are discovered, when the network parameter thresholds are set or read, and when higher layer protocols issue commands to the non-AP STA through the MSGCF-ESS-Link-Command.request primitive.

11B.4 MAC state generic convergence SAP

The MAC state generic convergence SAP is the interface between the convergence function and higher layer protocols. It presents a standardized interface for higher layer protocols to access the state of the MAC, whether that state information is available in the MLME, PLME, or SME.

Some events on the MAC state generic convergence SAP require event identifiers for use as a dialog token in event sequencing and rollback. The EventID is an unsigned integer that is initialized to one when the non-AP STA leaves the STANDBY state.

11B.4.1 ESS status reporting

11B.4.1.1 MSGCF-ESS-Link-Up

11B.4.1.1.1 Function

This event is triggered when a new ESS has been made available for sending frames.

11B.4.1.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-Link-Up.indication(
NonAPSTAMacAddress,

ESSIdentifier
)

Name	Type	Valid range	Description
NonAP-STAMacAddress	MAC Address	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting that an IEEE 802.11 ESS has become available.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use. The HESSID is encoded in upper-case ASCII characters with the octet values separated by dash characters, as described in IETF RFC 3580 [B45].

11B.4.1.1.3 When generated

This primitive is generated when the ESS link to a network of APs is available to exchange data frames. The generation of this primitive may vary depending on the contents of dot11WEPDefaultKeysTable and dot11WEPKeyMappingsTable and the setting of dot11RSNAOptionImplemented.

If there are no entries in the dot11WEPDefaultKeysTable, no entry for the current AP in dot11WEPKeyMappingsTable, and dot11RSNAOptionImplemented is false, then the network does not use encryption. This event is generated upon receipt of an MLME-Associate.confirm message with a result code of success.

If there are entries in the dot11WEPDefaultKeysTable, or an entry for the current AP in dot11WEPKeyMappingsTable, or dot11RSNAOptionImplemented is true, then the network requires the use of encryption on the link. Before declaring that the link is ready to exchange data frames, the convergence function will receive an MLME-Associate.confirm primitive along with an MLME-SetKeys.confirm, both with result codes of success. The latter primitive is used to ensure that a WEP key is available, or that the RSN 4-Way Handshake has completed.

This event is not triggered by MLME-Reassociate.confirm messages because MLME-Reassociate.confirm messages are defined as transitions within the same ESS.

The MLME-Associate.confirm primitive may be issued upon AP transitions. It is the objective of the MSGCF to generate this event only upon the initial connection to an IEEE 802.11 network, when the MSGCF state machine moves into the ESS_CONNECTED state.

11B.4.1.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by higher layers are outside of scope of this standard, but may include router discovery, IP configuration, and other higher layer protocol operations.

11B.4.1.2 MSGCF-ESS-Link-Down.indication

11B.4.1.2.1 Function

This event is triggered to indicate that an IEEE 802.11 ESS is no longer available for sending frames.

11B.4.1.2.2 Semantics of the service primitive

The event's parameters are as follows:

MSGCF-ESS-Link-Down.indication (
NonAPSTAMacAddress,
ESSIdentifier,
ReasonCode
)

Name	Type	Valid range	Description
NonAP-STAMacAddress	MAC Address	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting that an IEEE 802.11 ESS is no longer available.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.
ReasonCode	Enumerated	EXPLICT_DISCONNECT, KEY_EXPIRATION, LOW_POWER, VENDOR_SPECIFIC	Reason code, drawn from Table 11B-1.

Table 11B-1—Reason codes for network down

Name	Description
EXPLICIT_DISCONNECT	An explicit disconnection operation (Disassociation or Deauthentication) was initiated by the non-AP STA or the non-AP STA's current serving AP and the non-AP STA was unable to Reassociate to an alternate AP in the same ESS.
KEY_EXPIRATION	Keys used by an RSN SA have expired due to time or traffic limitations, or TKIP countermeasures have invalidated the key hierarchy.
LOW_POWER	If the SME reports that the IEEE 802.11 interface was shut down to conserve power, that event may be reported to higher level protocols.
VENDOR_SPECIFIC	Vendor-specific usage.

11B.4.1.2.3 When generated

This event is generated when the SME declares that connectivity to an ESS is lost. It may be generated in the case of an explicit disconnection from the link peer, received as an MLME-Deauthenticate.indication or an MLME-Diassociate.indication primitive message. The SME should wait for a period of dot11ESSDisconnectFilterInterval before declaring connectivity lost to ensure that a non-AP STA is unable to reassociate to any alternate AP within the ESS.

11B.4.1.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include removing entries from routing and forwarding tables, and attempting to initiate handover of open application connections to network interfaces that are still active.

11B.4.1.3 MSGCF-ESS-Link-Going-Down

11B.4.1.3.1 Function

This event is triggered to indicate the expectation that IEEE 802.11 ESS will no longer be available for sending frames in the near future.

11B.4.1.3.2 Semantics of the service primitive

The event parameters are as follows:

MSGCF-ESS-Link-Going-Down.indication(
NonAPSTAMacAddress,
ESSIdentifier,
EventID,
TimeInterval,
ReasonCode
)

Name	Type	Valid range	Description
NonAP-STAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting that an IEEE 802.11 ESS is expected to go down.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use.
EventID	Integer	N/A	A string used to identify the event that is used in the case of event rollback.
TimeInterval	Integer	N/A	Time Interval, in time units, in which the link is expected to go down. Connectivity is expected to be available at least for time specified by TimeInterval.
Reason Code	Enumerated	EXPLICT_DISCONNECT, KEY_EXPIRATION, LOW_POWER, VENDOR_SPECIFIC	Indicates the reason the link is expected to go down, drawn from Table 11B-2.

Table 11B-2—Reason codes for ESS link down

Name	Description
EXPLICIT_DISCONNECT	An explicit disconnection operation (Disassociation or Deauthentication) was initiated by the non-AP STA or the non-AP STA's current serving AP.
KEY_EXPIRATION	Keys used by an RSN SA have expired due to time or traffic limitations, or TKIP countermeasures have invalidated the key hierarchy.
LOW_POWER	If the SME reports that the IEEE 802.11 interface will be shut down to conserve power, that event may be reported to higher level protocols.
VENDOR_SPECIFIC	Vendor-specific usage.

11B.4.1.3.3 When generated

This notification is generated by the MSGCF when the IEEE 802.11 ESS link is currently established and is expected to go down within the specified time interval. The network may be expected to go down because of an event whose timing is well understood, such as an explicit disconnection event observed on the MLME_SAP. It may also be expected as the result of a predictive algorithm that monitors link quality. The details of such a predictive algorithm used are beyond the scope of this standard.

The convergence function should attempt to deliver this event at least dot11ESSLinkDownTimeInterval time units before the link is predicted to go down. Different higher layer network protocols may require different levels of advance notice, and may configure the dot11ESSLinkDownTimeInterval attribute accordingly.

Not all thresholds in the dot11MACStateParameterTable are supported by every PHY. In the case when a threshold parameter is not supported (e.g., RSSI in clause 16), it is not applied.

11B.4.1.3.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include beginning preparations for handover.

11B.4.1.4 MSGCF-ESS-Link-Event-Rollback.indication

11B.4.1.4.1 Function

This event is used to indicate that specific previous reports or events are no longer valid and should be disregarded.

11B.4.1.4.2 Semantics of the service primitive

The event parameters are as follows:

```
MSGCF-ESS-Link-Event-Rollback.indication(
    NonAPSTAMacAddress,
    ESSIdentifier,
    EventID
    )
```

Name	Type	Valid range	Description
NonAP-STAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting that a previous event relating to an IEEE 802.11 ESS is no longer valid.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use.
EventID	Integer	N/A	A string used to identify the event that is used in the case of event rollback.

11B.4.1.4.3 When generated

This event is generated when a previous predictive event is no longer valid within its expiration time.

MSGCF-ESS-Link-Event-Rollback.indication is used in conjunction with MSGCF-ESS-Link-Going-Down. MSGCF-ESS-Link-Event-Rollback.indication events are issued when the prediction of link failure is no longer valid. Algorithms used to determine that link failure predictions are beyond the scope of this standard.

11B.4.1.4.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function to cancel any actions begun by the previous event. Actions taken by those higher layers are outside the scope of this standard, but may include cancelling any handover procedures started by the MSGCF-ESS-Link-Going-Down event.

11B.4.1.5 MSGCF-ESS-Link-Detected.indication

11B.4.1.5.1 Function

This event reports on the presence of a new IEEE 802.11 ESS.

11B.4.1.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-Link-Detected.indication(
NonAPSTAMacAddress,
ESSIdentifier,
ESSDescription
)

Name	Type	Valid range	Description
NonAP-STAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSDescription	As defined in Table 11B-3	N/A	A set of information about the ESS.

Table 11B-3—ESS description

Name	Syntax	Description
SSID	String	The SSID used by the ESS.
InformationSer-viceSupport	As described in Table 11B-4	A set of values indicating the type of information services supported on this network.
TriggerSupport	As described in Table 11B-4	A set of values indicating the support for the types of triggers that can be used to propose that the station take action.
RSN	As defined in 7.3.2.25	The RSN configuration of the ESS.
Interworking	As defined in 7.3.2.92	Interworking configuration of the ESS.

Table 11B-4—Trigger support values

Name	Description
MIH_CS_ES_Support	This network supports the IEEE 802.21 MIH Command Service and Event Service.
Vendor_Specific_Trigger_Support	This network supports a vendor-specific trigger service.

11B.4.1.5.3 When generated

Support for MIH is indicated by the presence or absence of the relevant Advertisement Protocol IDs in the Advertisement Protocol element.To maintain the list of detected networks, the SME issues recurring MLME-SCAN.request primitives to the MLME. The SME may schedule these requests to avoid interruption of user traffic. Responses to these requests, received in the MLME-SCAN.confirm primitives, contain a list of detected networks. Each network is stored in the MIB in the dot11MACStateESSLinkDetectedTable. This table holds a list of networks, organized by Network Identifier. Each entry in the table contains a list of BSSIDs within the network, as well as indications of support for MIH. Support for MIH is indicated by the presence or absence of the relevant Advertisement Protocol IDs in the Advertisement Protocol element. Each entry in the table will be held for at least dot11ESSLinkDetectionHoldInterval time units. When a non-AP STA has not observed an ESS for longer than dot11ESSLinkDetectionHoldInterval, it may be removed from the table.

This event is generated when a new entry is made into the dot11MACStateESSLinkDetectedTable. Modifications to existing entries in the list, such as an update to the BSSID list, do not trigger this event.

11B.4.1.5.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

11B.4.1.6 MSGCF-ESS-Link-Scan.request

11B.4.1.6.1 Function

This function is used by higher layer protocols to request that the SME perform a scan operation for available ESSs.

11B.4.1.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Scan.request(
    SSID,
    HESSID,
    AccessNetworkType
    )
```

Name	Type	Valid range	Description
SSID	Octet string	0 – 32 octets	Specific or wildcard.
HESSID	As defined in 7.3.2.92	As defined in 7.3.2.92	The HESSID to search for. It can be set to all 1's for use as a wildcard to match all available HESSID values.
AccessNetwork-Type	As defined in 7.3.2.92	As defined in 7.3.2.92	This may be a specific value to match one type of networks, or all 1's to match all access network types.

11B.4.1.6.3 When generated

This request is generated when higher protocol layers request a list of available ESSs.

11B.4.1.6.4 Effect of receipt

The SME will generate a corresponding MLME-SCAN.request primitive to find available networks.

11B.4.1.7 MSGCF-ESS-Link-Scan.confirm

11B.4.1.7.1 Function

This function reports information on available ESSs to higher protocol layers.

11B.4.1.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Scan.confirm(
    NonAPSTAMacAddress,
    ESSIdentifiers,
    ESSDescriptions
    )
```

Name	Type	Valid range	Description
NonAP-STAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifiers	Set of Strings	N/A	An identifier for the network composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSDescriptions	Set of ESSDescriptions, as defined in Table 11B-3	N/A	A set of information about each discovered ESS.

11B.4.1.7.3 When generated

This primitive is generated when scan results are available for reporting to higher protocol layers, in response to an MSGCF-ESS-Link-Scan.request primitive.

11B.4.1.7.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

11B.4.2 Network configuration

11B.4.2.1 MSGCF-ESS-Link-Capability.request

11B.4.2.1.1 Function

This primitive requests a list of the capabilities supported by a network.

11B.4.2.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-Link-Capability.request(
NonAPSTAMacAddress,
ESSIdentifier
)

Name	Type	Valid range	Description
NonAP-STAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use.

11B.4.2.1.3 When generated

This primitive is issued to service higher layer protocols by reporting on the capabilities of a particular network.

11B.4.2.1.4 Effect of receipt

The convergence function retrieves the capabilities and reports them via the MSGCF-ESS-Link-Capability.confirm primitive.

11B.4.2.2 MSGCF-ESS-Link-Capability.confirm

11B.4.2.2.1 Function

This primitive reports the convergence function capabilities of the network to higher layer protocols.

11B.4.2.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-Link-Capability.confirm(
NonAPSTAMacAddress,
ESSIdentifier,

EssLinkParameterSet,
ReasonCode
)

Name	Type	Valid range	Description
NonAP-STAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use.
EventCapability-Set	As defined in Table 11B-5	N/A	list of supported events.
ReasonCode	Enumerated	SUCCESS, UNKNOWN_NETWORK, UNKNOWN_CAPABILITIES	An error code, if applicable.

Table 11B-5—Event Capability Set

Name	Type	Valid range	Description
NonAPSTAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESS-Link-Up	Boolean	true, false	indicates whether the MSGCF-ESS-Link-Up.indication event as defined in 11B.4.1.1 is supported.
ESS-Link-Down	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Down.indication event as defined in 11B.4.1.2 is supported.
ESS-Link-Going-Down	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Going-Down event as defined in 11B.4.1.3 is supported.
ESS-Link-Event-Roll-back	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Event-Rollback.indication event as defined in 11B.4.1.4 is supported.
ESS-Link-Detected	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Detected.indication event as defined in 11B.4.1.5 is supported.
ESS-Link-Threshold-Report	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Threshold-Report.indication event as defined in 11B.4.3.1 is supported.
ESS-Link-Command	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Command.request primitive as defined in 11B.4.4.1 is supported.

11B.4.2.2.3 When generated

This primitive is generated in response to the MSGCF-ESS-Link-Capability.request primitive to report whether or not specific events are supported.

11B.4.2.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function.

11B.4.2.3 MSGCF-Set-ESS-Link-Parameters.request

11B.4.2.3.1 Function

This primitive sets thresholds for reporting of network events.

11B.4.2.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-Set-ESS-Link-Parameters.request(
NonAPSTAMacAddress,
ESSIdentifier,
EssLinkParameterSet
)

Name	Type	Valid range	Description
NonAP-STAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSLinkParame-terSet	As defined in Table 11B-6	N/A	The EssLinkParameterSet is used to configure when event reports will be sent to higher protocol layers.

The ESSLinkParameterSet parameter is defined in Table 11B-6. It may include any or all of the elements in Table 11B-6.

Table 11B-6—ESS Link Parameter Set

Name	Type	Valid range	Description
PeakOperational-Rate	Integer	As defined in 7.3.2.2	The integer representing the desired peak modulation data rate used for data frame transmission.
MinimumOpera-tionalRate	Integer	As defined in 7.3.2.2	The integer encoding of the desired minimum modulation data rate used in data frame transmission
NetworkDownti-meInterval	Integer	0 – 65535	Desired advance warning time interval, in TUs, for MSGCF-ESS-Link-Going-Down events.

Table 11B-6—ESS Link Parameter Set *(continued)*

Name	Type	Valid range	Description
DataFrameRSSI	Integer	–100 to 40	The received signal strength in dBm of received Data frames from the network. This may be time-averaged over recent history by a vendor-specific smoothing function.
BeaconRSSI	Integer	–100 to 40	The received signal strength in dBm of Beacon frames received on the channel. This may be time-averaged over recent history by a vendor-specific smoothing function.
BeaconSNR	Integer	0 – 100	The signal to noise ratio of the received data frames, in dB. This may be time-averaged over recent history by a vendor-specific smoothing function.
DataFrameSNR	Integer	0 – 100	The signal to noise ratio of the received Beacon frames, in dB. This may be time-averaged over recent history by a vendor-specific smoothing function.
DataThroughput	Integer	0 – 65535	The data throughput in megabits per second, rounded to the nearest megabit. This may be time-averaged over recent history by a vendor-specific smoothing function.
MissedBeaconRate	Real	N/A	The rate at which beacons have not been received in missed beacons per second. This may be time-averaged over recent history by a vendor-specific smoothing function.
FrameErrorRate	Real	N/A	The frame error rate of the network in errors per second. This may be time-averaged over recent history by a vendor-specific smoothing function.
VendorSpecific	Vendor Specific	As defined by 7.3.2.26	Additional vendor-specific parameters may be included in this event.

11B.4.2.3.3 When generated

This event is generated when higher protocol layers wish to set the performance parameters for a network. Higher protocol layers are responsible for ensuring that the set of configured network parameters is consistent with all subscribers to those higher layer protocols.

11B.4.2.3.4 Effect of receipt

Parameters supplied in the event are stored in the MIB, either in the dot11MACStateConfigTable or the dot11MACStateParameterTable.

11B.4.2.4 MSGCF-Set-ESS-Link-Parameters.confirm

11B.4.2.4.1 Function

This primitive indicates whether network parameters were accepted.

11B.4.2.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-Set-ESS-Link-Parameters.confirm(
NonAPStaMacAddress,
ESSIdentifier,
EssLinkParameterSet,
ResultCode
)

Name	Type	Valid range	Description
NonAP-STAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParame-terSet	As defined in Table 11B-6	N/A	The EssLinkParameterSet is used to configure when event reports will be sent to higher protocol layers.
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS	The result code of the parameter set operation.

11B.4.2.4.3 When generated

This primitive is generated in response to the MSGCF-Set-ESS-Link-Parameters.request primitive and is used to indicate whether the parameter set was accepted.

11B.4.2.4.4 Effect of receipt

The SME is notified of the new parameter set.

11B.4.2.5 MSGCF-Get-ESS-Link-Parameters.request

11B.4.2.5.1 Function

This primitive retrieves the current network parameters for a specific network.

11B.4.2.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-Get-ESS-Link-Parameters.request(
ESSIdentifier
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use.

11B.4.2.5.3 When generated

This primitive is used by higher layers to retrieve the currently stored parameters for a network.

11B.4.2.5.4 Effect of receipt

The SME retrieves the network parameters and makes them available through the MSGCF-Get-ESS-Link-Parameters.confirm primitive.

11B.4.2.6 MSGCF-Get-ESS-Link-Parameters.confirm

11B.4.2.6.1 Function

This primitive reports the current network parameters.

11B.4.2.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-Get-ESS-Link-Parameters.confirm(
    ESSIdentifier,
    EssLinkParameterSet,
    ResultCode
    )
```

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParame-terSet	As defined 11B.4.2.3	N/A	The EssLinkParameterSet is used to configure when event reports will be sent to higher protocol layers.
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS	The result code of the parameter get operation.

11B.4.2.6.3 When generated

This primitive is generated by the MSGCF as a result of the MSGCF-Get-ESS-Link-Parameters.request primitive.

11B.4.2.6.4 Effect of receipt

The higher layer protocols are notified of the current network parameters.

11B.4.3 Network events

11B.4.3.1 MSGCF-ESS-Link-Threshold-Report.indication

11B.4.3.1.1 Function

This event reports that the layer 2 network performance has crossed a threshold set by the operations described in Table 11B-4.

11B.4.3.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-Link-Threshold-Report.indication(
NonAPSTAMacAddress,
ESSIdentifier,
EssLinkParameterSet,
ThresholdCrossingDirectionSet
)

Name	Type	Valid range	Description
NonAP-STAMacAd-dress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the threshold crossing.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParam-eterSet	As defined in Table 11B-6	N/A	list of EssLinkParameterSets and their current values that have crossed pre-set thresholds for alerts.
Threshold-CrossingDirec-tionSet	Set of ThresholdCrossing-Directions, one for each value in the EssLinkPa-rameterSet	UPWARD, DOWNWARD	Whether the parameter has crossed the threshold while rising or falling.

11B.4.3.1.3 When generated

The convergence function is responsible for monitoring network performance. If the monitored parameters cross the configured threshold, this event is generated to inform higher layer protocols.

11B.4.3.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include preparations for handover or assessing whether handover should be imminent.

11B.4.4 Network command interface

11B.4.4.1 MSGCF-ESS-Link-Command.request

11B.4.4.1.1 Function

This primitive requests that a STA take action for a network.

11B.4.4.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Command.request(
    NonAPSTAMacAddress,
    ESSIdentifier,
    CommandType
    )
```

Name	Type	Valid range	Description
NonAP-STAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the threshold crossing.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use.
CommandType	Enumerated	DISCONNECT, LOW_POWER, POWER_UP, POWER_DOWN, SCAN	Type of command to perform on the link as described in the following subclauses.

11B.4.4.1.3 When generated

This primitive is generated by a higher layer protocol.

11B.4.4.1.4 Effect of receipt

The convergence function will issue commands to the SME to implement the requested action on behalf of higher layers.

When the DISCONNECT command type is specified, the higher layer is requesting that the STA disconnect from its peer. When the SME on a non-AP STA receives this command, the SME issues an MLME-Deauthenticate.request to disconnect from the network, and the SME refrains from reconnecting to that network. When this command is issued on an AP, the AP issues an MLME-Disassociate.request to disconnect the specified non-AP STA from the specified ESS.

When the POWER_DOWN command type is specified, the SME will power down the non-AP STA. Before doing so, it may choose to notify the AP. This command is not valid on an AP STA.

When the POWER_UP command type is specified, the SME will start the non-AP STA.

When the LOW_POWER command type is specified, the higher layer is requesting that the IEEE 802.11 interface be placed in a low power mode. This action is accomplished by issuing an MLME-POWERMGT.request primitive with the PowerManagementMode parameter set to POWER_SAVE.

When the SCAN command type is specified, the higher layer is requesting that the STA search for IEEE 802.11 networks. This action is accomplished by issuing an MLME-SCAN.request primitive. Detected networks will be made available in the dot11MACStateESSLinkDetectedTable, as well as through the MSGCF-ESS-Link-Detected.indication event.

11B.5 MAC State SME SAP

11B.5.1 Mobility Management

11B.5.1.1 MSSME-ESS-Link-Down-Predicted.indication

11B.5.1.1.1 Function

This primitive indicates that the SME is predicting a link failure.

11B.5.1.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSSME-ESS-Link-Going-Down.indication(
NonAPSTAMacAddress,
ESSIdentifier,
TimeInterval,
ReasonCode
)

Name	Type	Valid range	Description
NonAP-STAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting that an IEEE 802.11 ESS is expected to go down.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID information element used to identify the network, concatenated with the value of the HESSID if it is in use.
TimeInterval	Integer	N/A	Time Interval, in time units, in which the link is expected to go down. Connectivity is expected to be available at least for time specified by *TimeInterval*.
Reason Code	Enumerated	EXPLICIT_DISCONNECT, LINK_PARAMETER_DEGRADATION, KEY_EXPIRATION, LOW_POWER, QOS_UNAVAILABLE, VENDOR_SPECIFIC	Indicates the reason the link is expected to go down.

11B.5.1.1.3 When generated

This notification is generated by the SME when the IEEE 802.11 network connection is currently established and is expected to go down. The details of the predictive algorithm used are beyond the scope of this standard. One method of implementing this function would be to generate this indication when link quality is fading and no better AP can be found.

11B.5.1.1.4 Effect of receipt

This indication is received by the MSGCF and is used to generate the MSGCF-ESS-Link-Down.indication event due to link parameter degradation.

Annex A

(normative)

Protocol Implementation Conformance Statement (PICS) proforma

A.2.1 Abbreviations and special symbols

A.2.2 General abbreviations for Item and Support columns

Insert the following new item at the end of the list in A.2.2:

IW interworking with external networks

A.4 PICS proforma–IEEE Std 802.11-2007[8]

A.4.3 IUT configuration

Insert the following entry at the end of the IUT configuration table:

Item	IUT configuration	References	Status	Support
*CF19	Is interworking with external networks service supported?	Extended Capabilities 7.3.2.27	(CF 15, CF8 & CF11):O	Yes ☐ No ☐

Insert A.4.22 after A.4.21 as following:

A.4.22 Interworking (IW) with external networks extensions

Item	Protocol capability	References	Status	Support

        DESCRIPTION
                "This is a control variable.

                It is written by the SME after the AP receives the
                permissions for the non-AP STA from the SSPN Interface.

                This attribute indicates the maximum authorized data rate in
                kbps the non-AP STA may use, either transmitting to an AP or
                receiving from an AP on the background access category. If
                this rate is exceeded, the AP should  police the flows
                traversing this AC. The value '4294967295', which is the
                default value, means that the SSP is not requesting the AP to
                limit the data rate used by the non-AP STA. Local
                configuration of the AP, however, may cause the rate to be
                limited, especially when the AC is configured for mandatory
                admission control."

        DESCRIPTION
             "This is a control variable.

             It is written by an external management entity or the SME.
             Changes take effect as soon as practical in the implementation.

             This attribute contains the national subdivisions (state,
             Region, province, prefecture). Example: California. The A1
             element is used for the top level subdivision within a country.
             In the absence of a country-specific guide on how to use the A-
             series of elements, the second part of the ISO 3166-2 code
             [ISO.3166-2] for a country subdivision SHOULD be used. The ISO
             3166-2 code is a formed of a country code and hyphen plus a
             code of one, two or three characters or numerals. For the A1
             element, the leading country code and hyphen are omitted and
             only the subdivision code is included.
```

```
            For example, the codes for Canada include CA-BC, CA-ON, CA-
            QC;Luxembourg has just three single character codes: LU-D, LU-G
            And LU-L; Australia uses both two and three character codes:
            AU-ACT, AU-NSW, AU-NT; France uses numerical codes for mainland
            France and letters for territories: FR-75, FR-NC."

Annex K

(informative)

Admission control

K.2 Recommended practices for contention-based admission control

K.2.1 Use of ACM (admission control mandatory) subfield

Change the text of K.2.1 as follows:

It is recommended that admission control not be required for the access categories AC_BE and AC_BK. The ACM subfield for these categories should be set to 0. The AC parameters chosen by the AP should account for unadmitted traffic in these ACs.

When dot11SSPNInterfaceActivated is true, it is recommended that any STA authenticated through an SSPN interface use admission control to access categories AC_VO and AC_VI to ensure network utilization consistent with the policy imposed by the SSPN for admission. AC parameters chosen by the AP should further account for any unadmitted traffic in AC_VO and AC_VI that may be reserved for users of a particular SSPN.

K.3 Guidelines and reference design for sample scheduler and admission control unit

K.3.1 Guidelines for deriving service schedule parameters

Insert the following new paragraph at the end of K.3.1:

When dot11SSPNInterfaceActivated is true, the HC polices all traffic flows from a non-AP STA authenticated against the maximum authorized data rates stored in the dot11InterworkingTable. Each SSPN-authenticated STA is given a maximum bandwidth allowance by the SSPN for each access category as well as scheduled access. The AP polices the SSPN-authenticated STA traffic flows to the maximum bandwidth allowance provided by the SSPN.

Annex X

(informative)

Interworking with external networks

The purpose of this informative annex is to describe and clarify the support for interworking with external networks including the support for network discovery and selection, QoS mapping, SSPN interface, and emergency services and to provide some background information and recommended practices.

X.1 Network discovery and selection

Interworking service provides features to support the network discovery and selection process a STA uses to choose the network with which to associate. GAS provides a non-AP STA access to an information server (e.g., an IEEE 802.21 IS), which can provide a rich set of information to aid the network discovery and selection process. In addition, interworking service provides lightweight features that also facilitate this process. The following subclauses describe several use cases illustrating how these features can be used to aid in network discovery and selection:

- **Airport:** A traveling businesswoman needs to connect via an airport hotspot to her enterprise network to download email and information from the customer database.
- **Shopping:** A shopper visits a shopping mall and wants to use a smartphone to discover items on sale.
- **Sales meeting:** A salesman visiting a customer accesses his guest network.
- **Museum:** A visitor to a museum uses a smartphone to obtain virtual docent service.
- **Emergency call:** A traveller has needs to make an emergency call while in another country.
- **Emergency alert:** A traveller, having enabled the display of emergency alerts, arrives at a new destination.

X.1.1 Airport

A traveling businesswoman arrives for the first time at an airport having a WLAN. This user wants to download email onto her laptop utilizing the airport's hotspot, a chargeable network. Once associated, the woman needs to connect via VPN connection back to her company's servers to access email and information from the customer database.

a) The laptop's non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID and an Interworking element with Access Network Type subfield set to "Chargeable Public Network."~~.~~ In response, it receives Probe Response frames from several of the airport's APs, in the immediate neighborhood, for the SSID "Narita Hotspot."~~.~~

b) The Probe Response received by the laptop indicated the following capabilities:

   1) Extended Capabilities information element indicates: AP provides interworking service.

   2) Interworking element indicates: Venue Group = 1 (Assembly) and Venue Type = 3 (passenger terminal), Internet = 1 (Internet access available), ASRA = 1 (there is an additional step required for network access).

   3) Advertisement Protocol element including the Advertisement Protocol ID set to MIH Information Service.

4) Roaming Consortium element present containing an OI for "Hotspot Roaming International."
5) There is no RSN element present in the received beacon frame.

c) Since the laptop's SME does not recognize the Roaming Consortium OI, it invokes the GAS protocol to query the network's IEEE 802.21 IS. The IEEE 802.21 IS's response indicates the roaming partners for "Narita Hotspot" and the laptop have security credentials for one of them.

d) Since the AP indicated ASRA = 1, the SME again invokes the GAS protocol to retrieve the Network Authentication Type information. The response indicates that https redirection is in use and provides the Re-direct URL of hotspot.narita.co.jp. Note that this is helpful since some networks use conditional redirection—that is, access to a walled garden is provided for free, but a subscription fee is required to access the Internet.

e) Since the laptop's SME now knows it should be able to successfully authenticate with the network, the STA associates to the AP.

f) The following operations are then carried out by higher layers operating within the laptop:
1) The laptop's SME autonomously launches an http client and provides to it the URL of hotspot.narita.co.jp, which provides the proper security credentials to the network and thereby successfully authenticates it to the network.
2) The VPN client is autonomously launched and a secure session to the user's corporate network is established. Then the user launches the email application to download email and other required information.

X.1.2 Shopping

A shopper visits a shopping mall and wants to use a smartphone to discover items on sale. In this mall, the mall's IT department is providing WLAN facilities for all the stores in the mall; therefore, there is only one SSID for shoppers (i.e., there is not a different SSID for each store in the mall). The user arrives at the mall and taps an icon on the screen to put the smartphone in "shopping mode." The smartphone's shopping application causes the non-AP STA to carry out the following steps:

a) The smartphone's non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID and an Interworking element with Access Network Type subfield set to "Free Public Network." In response, it receives Probe Response frames from several of the mall's APs, but only one SSID is provided, which is "Silicon Valley Mall." The mall's APs did not transmit Probe Responses for the SSIDs "Engineering," "Deliveries," and "Janitorial" since their Access Network Type is "Private network."

b) The Probe Response received by the smartphone indicated the following capabilities:
1) Extended Capabilities information element indicates: AP provides interworking service.
2) Interworking element indicates: Venue Group = 6 (mercantile) and Venue Type = 4 (shopping mall), Internet = 0 (unspecified).
3) RSN element indicates: IEEE 802.1X authentication.

c) Since the AP indicated Interworking service is available, the smartphone's non-AP STA uses the MLME-GAS.request primitive to invoke GAS to request the ANQP Capability list (see 7.3.4.2). In the ANQP Capability list, the AP has indicated support for Venue Name and Domain Name list. Subsequent to receipt of the ANQP Capability list, the non-AP STA invokes the MLME-GAS.request primitive to retrieve the other two lists.

d) Next, the non-AP STA's Supplicant searches the received Domain Name list to determine whether it has any stored credentials for these domains. If so,:
1) The smartphone autonomously associates to the "Silicon Valley Mall Shopping" SSID and displays the following information:
i) Venue Name: Silicon Valley Mall, 1234 Main Street, Rownhams, CA 98765-1234
ii) SSID: Silicon Valley Mall

iii) Venue type: Shopping Mall

4) The Supplicant autonomously provides the security credentials for the selected domain.

e) Higher layer protocols then download discount coupons being offered for items on sale.

X.1.3 Sales meeting

A salesman travels across town to a meeting at ACME Manufacturing. While there, this user needs to send email to get a document from engineering. On his laptop, he requests the WLAN via the laptop's UI to search for guest networks. The laptop performs the following steps:

a) The laptop's non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID and an Interworking element with Access Network Type subfield set to "Private Network with Guest Access." In response, it receives Probe Response frames from several of ACME Manufacturing's APs, but only one SSID is provided, which is "Guest." ACME Manufacturing's APs did not transmit Probe Responses for the SSIDs "Engineering" and "Finance" since their Access Network Type is "Private network."

b) The Probe Response received by the laptop indicated the following capabilities:

1) Extended Capabilities information element indicates: AP provides interworking service.

2) Interworking element indicates: Internet is available, Venue Group = 2 (Business) and Venue Type = 8 (Research and Development Facility).

3) RSN element indicates: IEEE 802.1X authentication with CCMP pairwise and group cipher suites.

c) Since the AP indicated interworking service is available, the laptop's non-AP STA uses the MLME-GAS.request primitive to invoke GAS to request the ANQP Capability list (see 7.3.4.2). In the ANQP Capability list, the AP has indicated support for Venue Name. Upon receipt of the ANQP Capability list, the non-AP STA again invokes the MLME-GAS.request primitive to retrieve the Venue Name.

d) The laptop's UI displays the following information and automatically associates to the network:

1) SSID: Guest (Type: Private network with Guest access)

2) Venue Name: ACME Manufacturing, 1234 Main Street, Rownhams, CA 98765-1234

3) Venue Type: Research and Development Facility

4) Internet is available

e) Upon prompt, the user enters the username and password supplied by his point of contact from ACME Manufacturing and is then able to send and receive email.

X.1.4 Museum

A visitor enters a museum that is advertising virtual docent service (audio tracks describing each of the major exhibits). The visitor taps an icon on a smartphone and requests it to search for free networks. The smartphone then carries out the following:

a) The smartphone's non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID and an Interworking element with Access Network Type subfield set to "Free Public Network." In response, it receives Probe Response frames from several of the museum's APs, but only one SSID is provided, which is "Visitors." The museum's APs did not transmit Probe Responses for the SSID "Maintenance" since its Access Network Type is "Private network."

b) The Probe Response received by the smartphone indicated the following capabilities:

1) Extended Capabilities information element indicates: AP provides interworking service.

2) Interworking element indicates: Venue Group = 1 (assembly), Venue Type = 9 (museum), and ASRA = 0 (no additional steps are required for access).

c) Since the AP indicated interworking service is available, the smartphone's non-AP STA uses the MLME-GAS.request primitive to invoke GAS to request the ANQP Capability list (see 7.3.4.2). In the ANQP Capability list, the AP has indicated support for Venue Name. Upon receipt of the ANQP Capability list, the non-AP STA again invokes the MLME-GAS.request primitive to retrieve the Venue Name.

d) The smartphone's UI displays the following information, asking the user whether or not they wish to connect to the network:

1) Venue Name: Museum of Modern Art (MOMA)

2) SSID: Visitors

3) Venue Type: Museum

4) No authentication required

e) The user taps the "Connect" icon on the smartphone's display. Note that the smartphone's non-AP STA knows that the network uses open system authentication since there is no RSN element present in the beacon and ASRA = 0.

X.1.5 Emergency call

A traveller has need to make an emergency call, while in another country. The traveler may not be aware of the emergency call numbers that are used in that country. Being in this new location for the first time, the traveller is not aware of which local access points provide access for emergency calling. (Note that emergency calling requires higher layer application(s) that are outside the scope of this standard.)

a) The traveller's non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID and an Interworking element. (If the non-AP STA is already associated with an AP that has indicated support for emergency service in its beacon, the probe request would not be necessary.)

b) In response, it receives Probe Response frames from one or more APs indicating support for emergency service in the Access Network Options field of the Interworking element.

1) Extended Capabilities information element indicates: AP provides interworking service.

2) Emergency services reachability is indicated by the ESR and UESA fields in the Access Network Options field in the Interworking element.

3) A dedicated emergency services network is indicated by the Access Network Type field in the Interworking element.

c) The traveller's non-AP STA then requests the Emergency Call Number information with a GAS Initial Request Action frame or, in the case of a multimedia emergency call, requests the Emergency URN information.

d) The GAS Initial Response Action frame from the AP provides the Emergency Call Number (or URN) information.

e) This information is passed to the higher layer application in the traveller's non-AP STA.

f) The traveller's non-AP STA then associates with the AP.

g) The traveller's non-AP STA then places the emergency call, with an expedited bandwidth request (EBR) in an ADDTS Action frame to provide priority to the emergency call.

X.1.6 Emergency alert

A traveller has enabled the display of emergency alerts on a wireless device (non-AP STA) by appropriately setting the higher layer emergency alert application on the device. The traveller arrives at a new destination

and turns on the device. The device, when switched on, will perform a search and then associate with an AP to which the traveller has a subscription or associate with an open AP (if the traveller has enabled the device to do that). During the steps leading up to association, the device, when it becomes aware of an emergency alert, will obtain and display it. The emergency alert will likely be obtained from the AP that has the service to which the traveller has subscribed, but the device may also obtain the emergency alert from other APs, if an AP to which the traveller has a subscription is not available.

a) The traveller's non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID. If it is associated with an AP, it checks the beacon.

b) In response, it receives Probe Response frames from one or more APs, which it checks (or, alternately, checks the beacon) for the subscription and also whether the Emergency Alert information element indicates that there are emergency alert message(s).

c) If there are one or more emergency alert messages to be downloaded, the Emergency Alert Identifier element provides an Alert Identifier Hash value.

d) The device uses the hash of each of the available emergency message(s) to determine whether that message has already been received, or whether it is a new message that must be downloaded.

e) If there are one or more emergency alert messages to be downloaded, the device forms the EAS Message URI by concatenating the Emergency Alert Server URI with the hexadecimal numerals of the Alert Identifier Hash, using the specified method.

f) Should the device be unassociated with an AP when it determines that a new emergency alert is available, it retrieves the EAS message using either GAS procedures with Advertisement Protocol ID field set to the value for EAS. If the device is associated with the AP, it retrieves the EAS message using either GAS procedures with Advertisement Protocol ID field set to the value for EAS or, preferably, HTTP using Internet Protocols.

X.2 QoS mapping guidelines for interworking with external networks

The EDCA and HCCA mechanism defined in 9.9 provide QoS control at the MAC layer. However, the QoS control parameters used by the EDCA and HCCA can not match directly with other QoS control parameters of the interworked external networks, e.g., SSPN. For example, the SSPN could have different metrics for defining the QoS levels. Destination Network 1 (DN1) and DN2 can use DSCP values differently, in which case, STA1 and STA2 would require different QoS mapping information. Therefore, mapping from these external QoS control parameters to the QoS parameters of this standard is necessary.

The QoS parameters mapping can be used for both uplink and downlink data transmission:

— For uplink: at the non-AP STA, external QoS parameters are mapped to IEEE 802.11 QoS parameters, e.g., DSCP to IEEE 802.11 User Priority and in turn to EDCA ACs. This mapping helps the non-AP STA to construct correct QoS requests to the AP, e.g., ADDTS Request and to transmit frames at the correct priority.

— For downlink: at the AP, DSCP values are mapped to EDCA UPs. Optionally, the non-AP STA can use TSPEC and TCLAS elements in an ADDTS Request frame to setup a traffic stream in the BSS. In this method, the User Priority is specified in the TCLAS element. The policy used by the AP to choose a specific method to map frames to user priorities is outside the scope of this standard.

Different external networks can use different DSCP sets for the same services as described in X.2.2. For example, a 3GPP network can use different code points from that of an enterprise network. The QoS Map distribution mechanism defined in 11.23.9 provides means to communicate to the STA's mapping information from the network.

X.2.1 Determination of the mapping for a STA

The QoS mapping to be applied depends upon the network the non-AP STA is accessing. In an interworking IEEE 802.11 infrastructure setting, the same physical AP can serve non-AP STAs from different SSPNs on different BSSIDs. As such, these STAs are separated into different BSSs. Figure X-1 presents an example of the scenario using authentication, authorization, and accounting (AAA). In Figure X-1, AAA Server 1 controls access to DN-1 and AAA Server 2 controls access to DN-2.

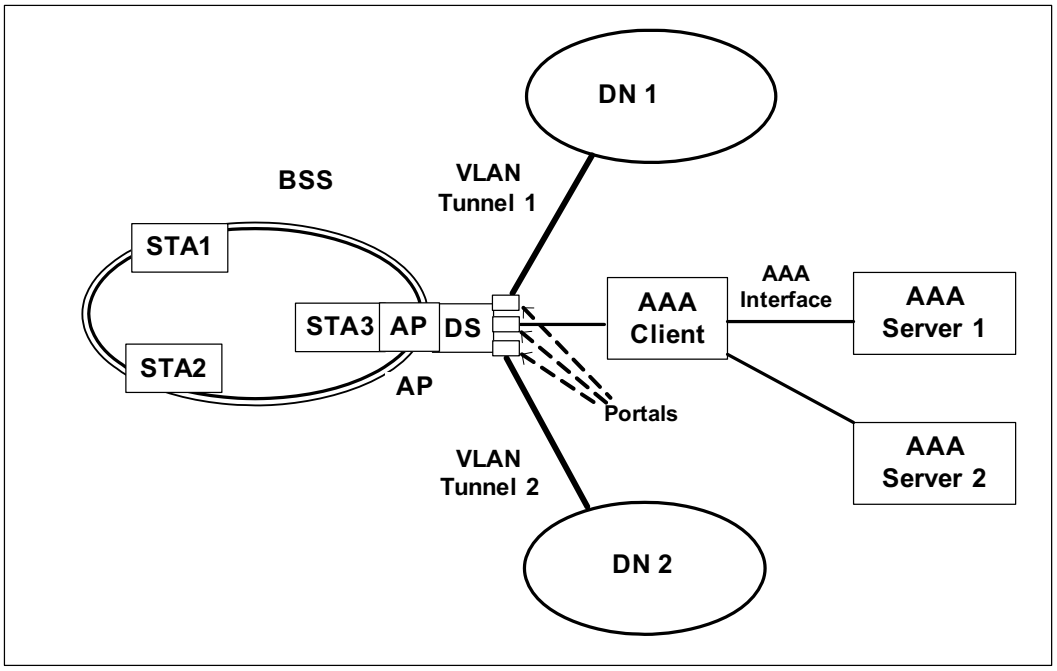

Figure X-1—Interworking IEEE 802.11 infrastructure supporting multiple SSPNs

X.2.2 Example of QoS mapping from different networks

IEEE 802.1d UPs map to EDCA ACs, as described in Table 9-1 UP-to-AC mappings. The use of DSCP sets differs from network to network. Table X-1 shows examples of DCSP mappings.

NOTE—The mapping of the DSCP to 3GPP Traffic Class is available in GSMA, IR.34 v4.6 [B43] (similar to that of GSMA IREG34). See TR 21.905 [B39] for definition of general packet radio service (GPRS) roaming exchange. Table X-1 is extended to cover the EDCA ACs mapping. This mapping can also apply to other networks that adopt the 3GPP QoS definitions, e.g., 3GPP2.

Table X-1—Mapping table of DSCP to 3GPP QoS information and EDCA ACs

3GPP QoS Information		DiffServ PHB	DSCP	QoS Requirement on GPRS Roaming Exchange				EDCA Access Category	UP (as in IEEE 802.1d)
Traffic Class	THP			Max Delay	Max Jitter	MSDU Loss	MSDU Error Ratio		
Conversational	N/A	EF	101110	20 ms	5 ms	0.5%	10^{-6}	AC_VO	7, 6
Streaming	N/A	$AF4_1$	100010	40 ms	5 ms	0.5%	10^{-6}	AV_VI	5, 4
Interactive	1	$AF3_1$	011010	250 ms	N/A	0.1%	10^{-8}	AC_BE	3
	2	$AF2_1$	010010	300 ms	N/A	0.1%	10^{-8}	AC_BE	3
	3	$AF1_1$	001010	350 ms	N/A	0.1%	10^{-8}	AC_BE	0
Background	N/A	BE	000000	400 ms	N/A	0.1%	10^{-8}	AC_BK	2,1

Table X-2 shows an example mapping based on application classes defined in RFC 4594. Mapping between DSCP and UP can be done using Exception fields or by range. The use of Exception fields will map a DSCP to a UP according to Table X-2. Mapping by range will require the setting of DSCP ranges as shown in Table X-3.

Table X-2—Example Enterprise DSCP to UP/AC mapping

Application Class	Per-hop behavior (PHB)	IEEE 802.1d User Priority	Access Category
Network Control	CS6	7	AC_VO
Telephony	EF	6	AC_VO
RT Interactive	CS4	6	AC_VO
Multimedia Conference	AF4x	5	AC_VI
Signaling	CS5	5	AC_VI
Broadcast Video	CS3	4	AC_VI
Multimedia Stream	AF3x	4	AC_VI
Low Latency Data	AF2x	3	AC_BE
High Throughput Data	AF1x	2	AC_BE
OAM	CS2	2	AC_BE
Standard	DF	0	AC_BE
Low Priority/Background	CS1	1	AC_BK

Table X-3—UP to DSCP range mapping example

UP Range	DSCP Low	DSCP High
UP 0 Range	0	0
UP 1 Range	1	9
UP 2 Range	10	16
UP 3 Range	17	23
UP 4 Range	24	31
UP 5 Range	32	40
UP 6 Range	41	47
UP 7 Range	48	63

Furthermore mapping by range will require an additional exceptional element to map DSCP 32 to UP 6.

NOTE—Twenty-one Exception fields are provided to give more flexibility in defining the QoS Map and it is currently the number of Fibs defined by the IETF.

X.3 Interworking and SSPN interface support

The interworking service architecture defines the scope of the SSPN interface. This interface is provided by the IEEE 802.11 MAC to support the interworking service. In an interworking scenario, the IEEE 802.11 infrastructure is operating in infrastructure mode.

Figure X-2 shows an example implementation of the control aspect of the Interworking Interface. As shown in the figure, the Interworking Interface consists of two parts: the generic SSPN Interface between the AP and the AAA Client; and the AAA Interface between the AAA Client and the corresponding AAA Server in the SSPN. Depending on the implementation the AAA Client can be co-located with the AP or stand alone serving as a proxy or translation agent between the SSPN Interface and AAA Interface. The AAA Interface serves as a transparent carrier of the SSPN interface.

The possible interactions over the SSPN interface are defined in 11.23.5. The information transferred over the SSPN Interface is defined in X.3.1. This interface results in parameters being set in the dot11InterworkingTable MIB. The AP's SME thereafter uses these parameters to permit or deny, as appropriate, services to non-AP STAs.

X.3.1 SSPN interface parameters

The parameters for each associated non-AP STA defined in this clause cross the SSPN Interface, i.e., between AP and AAA Client as shown in Table X-4.

The SSPN Interface parameters are stored in the AP with corresponding MIB attributes as defined in Annex D, and are used by the Interworking Service Management function in the SME. The MIB variables themselves, which are used by the APs SME, are read only.

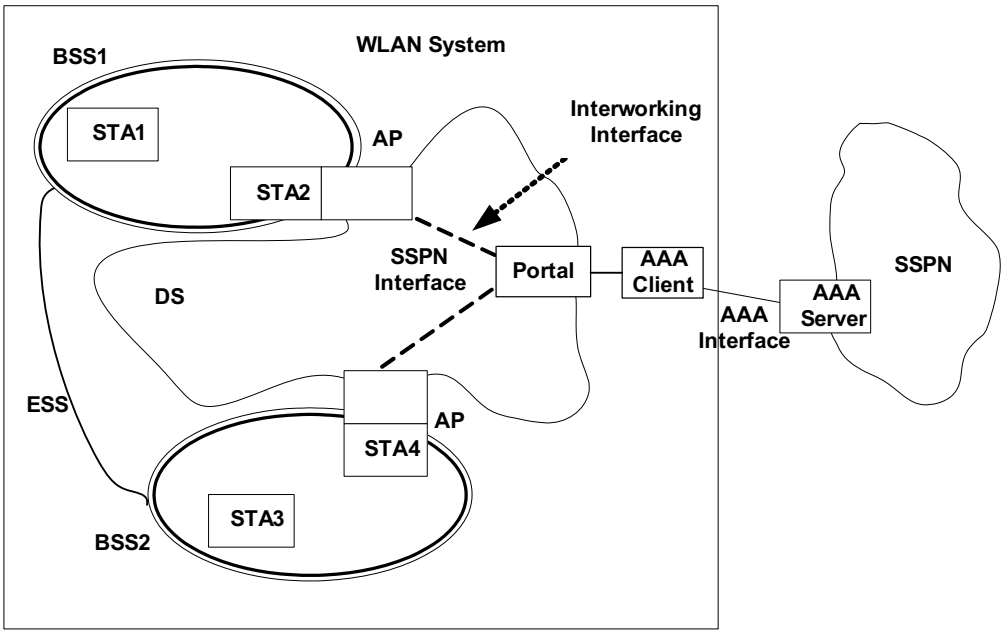

Figure X-2—Basic architecture of the interworking service

Table X-4—SSPN Interface information or permission parameters

Information or permission name	From AN to SSPN	From SSPN to AN	Per non-AP STA entry
Non-AP STA MAC	+		+
Non-AP STA User ID	+	+	+
Non-AP STA Interworking Capability	+		+
Link Layer Encryption Method	+		+
Authorized Priority		+	+
Authorized Rate		+	+
Authorized Delay		+	+
Authorized Service Access Type		+	+
Authorized Service Access Information		+	+
non-AP STA Transmission Count	+		+
non-AP STA Location Information	+		+
non-AP STA state Information	+		+

X.3.1.1 Non-AP STA MAC

This is the MAC address of the non-AP STA accessing the interworking service through the AP. It can be requested by the external network, e.g., a 3GPP network, for fraud prevention. The non-AP STA MAC address is normally available through MLME-SAP, e.g., MLME-ASSOCIATE.indication, and should be forwarded by the AS to the AAA Server entity in the SSPN through the AAA Interface.

The AP stores the non-AP STA MAC address in the corresponding dot11NonAPStationMacAddress element of its MIB.

X.3.1.2 Non-AP STA user ID

This parameter contains the subscriber information of the non-AP STA for the interworking service. It is provided by the non-AP STA through the RSNA establishment process to the AAA Server; in turn, the AAA Server provides it back to the AP via the SSPN interface. It is in the form of a NAI, i.e., it contains both the user's identity and its SSP information.

NOTE—The reason the AAA Server provides the user identity back to the AP is that some EAP methods use encrypted tunnels to maintain confidentiality of the user and thus the AP might not otherwise be able to learn the user's identity.

The AP stores the associated non-AP STA User ID in the corresponding dot11NonAPStationUserIdentity element of its MIB.

X.3.1.3 Non-AP STA interworking capability

This parameter is derived from the non-AP STA's Extended Capabilities information element, which is included in (Re)Association Request frames.The AP SME obtains this information from the MLME-SAP, e.g., MLME-ASSOCIATE.indication. This information needs to be passed over the SSPN interface since the service authorization decisions can depend on the non-AP STA capabilities.

The AP stores the associated non-AP STA Interworking Capability in the corresponding dot11NonAPStationInterworkingCapability element of its MIB.

X.3.1.4 Link layer encryption method

This parameter indicates the link layer encryption method selected during the RSNA establishment process for protecting the unicast communication between the non-AP STA and the AP. The cipher suite format of this element is drawn from the RSN information element defined in clause 7.3.2.25. The AP obtains this information about the STA via the MLME SAP.

In the interworking service, the SSPN also participates in the selection of the cipher suite selection, as described in 11.23.5. Therefore, the link layer encryption method selected will meet or exceed the security requirement of the SSPN.

NOTE—In interworking, the SSPN can require visibility and configurability of the STA access.

With this information available to the SSPN, the operator would be able to have better control, e.g., barring access to IEEE 802.11 networks if null encryption is used. This is also related to the operator network's configuration, e.g., if pre-authentication should be supported.

The AP stores the information in the corresponding dot11NonAPStationCipherSuite element of its MIB.

X.3.1.5 Authorized priority

This parameter is used for admission control and user-priority policing at the AP. It is based on the Infrastructure Authorization Information delivered from the SSPN during the AAA procedure. The Authorized Priority specifies the authorized User Priorities that the non-AP STA is allowed to use during the Interworking access. It also specifies whether the non-AP STA can use HCCA.

For EDCA operation, the AP stores the information in its corresponding dot11NonAPStationAuthAccessCategories element of its MIB after mapping the priority according to Table 9-1. For HCCA operation, the AP stores the information in dot11NonAPStationAuthHCCAHEMM.

X.3.1.6 Authorized maximum rate

This parameter is used for admission control decisions or policing actions at the AP. It is based on the Infrastructure Authorization Information delivered from the SSPN during the AAA procedure. For EDCA operation, this element contains a list of four MaxRate subelements indicating the maximum rate allowed for the access categories. For HCCA operation, there is one MaxRate subelement. Each of the MaxRate is an unsigned integer and in the unit of kilobits per second. An additional subelement provides the maximum rate at which a non-AP STA can source group addressed frames.

The AP stores the information in the corresponding dot11NonAPStationAuthMaxVoiceRate, dot11NonAPStationAuthMaxVideoRate, dot11NonAPStationAuthMaxBestEffortRate, dot11NonAPStationAuthMaxBackgroundRate, dot11NonAPStationAuthMaxHCCAHEMMRate and dot11NonAPStationAuthMaxSourceMulticastRate elements of its MIB.

X.3.1.7 Authorized service access type

This per-non-AP STA parameter indicates the access type allowed for the non-AP STA based on the SSPN decision. The AP will use this information for authorization requests from the STA, e.g., allow or disallow direct link operation and group addressed services. The information element uses TruthValues to indicate the service type authorized. The following MIB variables are used:

— dot11NonAPStationAuthDls is to authorize a non-AP STA to use DLS

— dot11NonAPStationAuthSinkMulticast is to authorize a non-AP STA to request group addressed stream(s) from the network

— dot11NonAPStationAuthMaxSourceMulticastRate is to authorize a non-AP STA to source group addressed stream(s) to towards the network

X.3.1.8 Authorized delay

This parameter is used for admission control decisions at the AP. It is based on the Infrastructure Authorization Information delivered from the SSPN during the AAA procedure. This element is only used for HCCA operation, and contains one subelement. An AP should deliver frames to a non-AP STA within the time period specified in this attribute. Furthermore, when a non-AP STA requests admission control, the requested delay is only approved if it is equal to or greater than the value stored in the corresponding element. Each element is an unsigned integer that measures delay in units of microseconds.

The AP stores the information in the corresponding dot11NonAPStationAuthHCCAHEMMDelay elements of its MIB.

X.3.1.9 Authorized service access information

This parameter contains the relevant information for the AP to enforce the authorized service access type indicated in the Authorized Service Access Type element.

The Authorized Service Access parameters provide the VLAN assignment (VLAN ID and name) to which frames to or from the non-AP STA are bridged. The element includes VLAN ID (dot11NonAPStationVLANId) and VLAN Name (dot11NonAPStationVLANName).

X.3.1.10 Non-AP STA transmission count

This parameter indicates the count of the data traffic transmitted to and received from a non-AP STA. Such information would be used by the on-line charging and accounting function, especially for the IEEE 802.11 WLAN local service, where the data traffic does not necessarily go through the SSPN network. In such cases, Layer 3 accounting/charging information is not reliable since addresses could be spoofed. Layer 2 would be a better place to collect such information since due to the cryptographic security association that exists between the non-AP STA and AP.

The non-AP STA Transmission Count element includes information stored in the corresponding dot11NonAPStationVoiceMSDUCount, dot11NonAPStationVideoMSDUCount, dot11NonAPStation-BestEffortMSDUCount, dot11NonAPStationBackgroundMSDUCount, dot11NonAPStationHCCA-HEMMMSDUCount, dot11NonAPStationMulticastMSDUCount, dot11NonAPStationVoiceOctetCount, dot11NonAPStationVideoOctetCount, dot11NonAPStationBestEffortOctetCount, dot11NonAPStation-BackgroundOctetCount, dot11NonAPStationHCCAHEMMOctetCount, dot11NonAPStationMulticast-OctetCount elements of the AP's MIB.

X.3.1.11 Non-AP STA location information

This parameter provides information about the STA's location to the SSPN. It is required by the SSPN applying location based service control. In the IEEE 802.11 network, the non-AP STA location is approximated using the AP's location information. This includes two type of formats, Geospatial and Civic Location.

The information to be placed in the non-AP STA Location information element is obtained from the dot11APGeospatialLocation and dot11APCivicLocation elements of the AP MIB.

X.3.1.12 Non-AP STA State Information

This parameter indicates whether non-AP STA is Active Mode or Power Saving. Information in this element is obtained from the corresponding dot11NonAPStationPowerManagementMode element of the associated AP MIB.

X.4 Interworking with external networks and emergency call support

Emergency services define the IEEE 802.11 functionality to support an emergency call (e.g., E911) service as part of an overall multi-layer solution, specifically capability advertisement and access to emergency services by STAs not having proper security credentials. "Multi-layer" indicates that emergency services will be provided by protocols developed in part by other standards bodies, see IETF ECRIT [B42], 3GPP TS 23.167 [B38], and 3GPP TS 22.067 [B41]. Three features of interworking with external networks support emergency call services.

The first feature is a mechanism for a non-AP STA to signal to an AP that a call is an emergency call. This is useful in the case where the access category to be used to carry the emergency call traffic (typically AC_VO) is configured for mandatory admission control. If the WLAN is congested, then the AP can deny the TSPEC request for bandwidth to carry the call. However, if the AP is able to determine that the call is an emergency call, then it can invoke other options to admit the TSPEC request.

The second and third features provide the means for a client without proper security credentials to be able to place an emergency call. The second feature makes use of the Interworking information element, which can be included in Association request frames in order to bypass the IEEE 802.1X port at an AP for unauthenticated access to emergency services. This is described further in X.4.4. The third feature makes use of an SSID configured for Open Authentication to provide emergency services and is described in X.4.2.

The STA has the burden to confirm the availability of emergency services from the IEEE 802.11 network, including that the network is authorized for emergency services. The time it takes for a client to find an authorized emergency services network is related to the speed of forward progress the authorized network can make over the air with the STA, relative to all of the other networks (attackers as well), and is inversely related to the number of false advertisements. A STA can confirm the availability of emergency services by observing the value of the Access Network Type, ESR and UESA fields in the Interworking element of any received Beacon or Probe response frame.

X.4.1 Background on emergency call support over IEEE 802.11 infrastructure

Special handling for emergency service calls is required over IEEE 802.11. To use a public hotspot a user will go typically through an authentication process (e.g., EAP-based, or http/https redirect or DNS redirection) before being able to use it for emergency calls.

There is a need to support these emergency services both when the user has a relationship with the IEEE 802.11 network (credentials to access the network) and when it does not have any relationship with the IEEE 802.11 network.

The former case requires no changes to the authentication process—the user, having already been authenticated to and associated with the WLAN, simply dials the emergency number thereby placing the call.

In the latter case, the non-AP STA will be able to gain access to the network without using security credentials and make an emergency call.

Another difficulty is that once the user gains access to the network, there is no mechanism to prioritize their emergency traffic in the IEEE 802.11 MAC over that of other users, even with IEEE 802.11 QoS capability.

Supporting emergency services, such as E911 calling, requires a multi-layer solution with support at various protocol layers. Apart from MAC level access and support for transfer of data between non-AP STA and AP with appropriate QoS at layer 2, there is a clear need, above this layer, to setup the call, conduct call control and management, and use an appropriate audio codec.

One specific example is when a user arrives in a new country and needs to make an emergency call in a public hotspot where there is no prior relationship with the available WLAN network or WLAN hotspot operator.

NOTE—The callback feature, if required in a regulatory domain, is dealt with at a higher layer.

X.4.2 System aspects for emergency call support

An IEEE 802.11 infrastructure by itself cannot ensure that all factors are compatible for an emergency service call to actually take place. The client device may have to register with a call manager (SIP agent or some other signaling endpoint) for the call to be placed successfully. Different signaling systems such as SIP, H.323, etc., can be deployed for supporting emergency service calling. Higher layers can also verify an emergency service call is being placed so that appropriate level of resources can be granted to the emergency call. Voice endpoints (e.g., non-AP STAs) can use different codecs such as G.711, AMR, and iLBC. All these functionalities are outside the scope of this standard.

IEEE 802.11 can provide priority for emergency traffic both for the initial call establishment and during an ongoing emergency call, which assumes advertisement of this functionality supported in the BSS.

This subclause describes general design assumptions to support emergency services with IEEE 802.11:

a) It is assumed that there is a higher layer (above IEEE 802.11 Layer 2) protocol (or protocol suite) for making emergency calls or using any other emergency services.

b) In order to make the emergency call procedure work properly, the non-AP STA has the following responsibilities:

   1) Recognize the user's request to make an emergency call.

   2) Non-AP STA will associate to the AP if it is not already done so. In an RSN, if the user does not have valid authentication credentials for network access then non-AP STA can bypass the RSN that will provide access to the network to make emergency calls.~~,~~

   3) Select an AP that supports QoS and EBR capability.

   4) If location information is required in a particular regulatory domain, request location information from the WLAN. If the STA cannot determine its own location by its own means, then Location information should be obtained from the network prior to initiating the emergency call request. There are two methods a non-AP STA can use to obtain location services from the IEEE 802.11 network:

      i) If the non-AP STA can use location information in Geospatial format (i.e., latitude, longitude and altitude), then the RRM capability can be used to obtain this information. The AP advertises RRM capability in its Beacon management frame (bit1 set to 1 in the Capability information field). In this case, the non-AP STA transmits an LCI Request to the AP using the procedures in 11.10.8.6.

         NOTE—The non-AP STA can receive an LCI Report with the incapable field set. According to the procedures in 11.10.8.6, the non-AP STA can re-submit an LCI Request with a location subject of "remote."~~.~~ If the AP still responds with incapable, then location services are not available from the AP via RRM capability.

      ii) If the non-AP STA requires location information in Civic or Geospatial formats, then an AP's wireless network management capability can be used. In this case, an AP advertises its ability to provide its location in with Civic or Geospatial format by setting the Civic Location or Geospatial Location field in the Extended Capabilities information element to 1. in the Beacon frame. A non-AP STA requests its location using the procedures in 11.23.7. Unlike an AP providing RRM capability, an AP Advertisement location capability will not return an "incapable" response if the non-AP STA requests the "remote" location.

   5) Selects one of possibly several SSPNs advertising support for emergency services and VoIP service.

c) There are two methods described in this annex by which a user lacking security credentials can gain access to the network. The method selected in any particular deployment is at the discretion of the IEEE 802.11 infrastructure provider, SSPN or system administrator as appropriate. The AP and non-AP STA should permit users lacking security credentials to gain access to a network using one of two methods:

   1) Using an emergency services association (see 7.3.2.92) in a BSS configured for RSNA. Using this type of association means the AP and non-AP STA will exchange unprotected frames for emergency service access only during the lifetime of the association. In this situation, cryptographic keys are not exchanged, the IEEE 802.1X uncontrolled port is bypassed without invoking the IEEE 802.1X state machine. Since protection is used for authenticated STAs, their traffic is protected.

   2) Using an SSID configured for Open System authentication. Network elements necessary to complete an emergency call are reachable via this SSID. How to reach these network elements

(e.g., a call manager) and which protocol to use (e.g., SIP) are outside the scope of this standard.

d) The AP can separate the backhaul of emergency services traffic from other traffic, typically via a dedicated VLAN.

To ease burden of implementation on the network side, some basic means should exist to allow easy filtering, routing and basic access control of "regular" BSS traffic and emergency-type BSS traffic. This can be assisted by the downloading of emergency call number information, as described in 7.3.4.4.

X.4.3 Description of the Expedited Bandwidth Request element

For access categories configured for mandatory admission control, a non-AP STA requests bandwidth using a TSPEC element in an ADDTS Request frame. The TSPEC Request includes parameters describing the characteristics of the traffic stream, but no information on the use of the traffic stream. The Expedited Bandwidth Request (EBR) element describes the "use" of a traffic stream. To use this element, it is the responsibility of the station to transmit this element in response to certain call signaling messages. How this is done is outside the scope for the interworking service. The following bandwidth uses are provided in the EBR element:

— Emergency call, defined in NENA 08-002 [B51]
— Public first responder (e.g., fire department)
— Private first responder (e.g., enterprise security guard)
— Multi-level precedence and preemption (MLPP)

MLPP services are provided by other voice networking technologies such as 3GPP (see 3GPP TS 22.067 [B40]), H.323 (see ITU-T H4.60.14) and other proprietary signaling protocols. MLPP is used as a subscription service to provide differentiated levels of consumer service; it is also used by military organizations so that commanding officers will not get a network busy signal.

If the AP is provided additional information regarding the nature of the Traffic Stream, it can invoke additional policy that can be configured on the AP to accept the TSPEC request when it would be otherwise denied. Policy configured at AP defines how bandwidth is allocated. Specification of these policies is outside the scope of interworking with external networks. Policy examples include the following:

— No action
— Pre-emptive action: delete a TS of lower priority if necessary to make room for new TS
— Use capacity allocated for non-voice services if priority is above a certain value (assuming TSPEC is for AC_VO)
— Interpret MLPP codes as defined 3GPP specification
— Interpret MLPP codes as defined in proprietary specification

X.4.4 Access to emergency services in an RSN

If a network requires authentication and encryption with RSN, a non-AP STA placing an emergency call associates and authenticate to the network by using an emergency services association (see 7.3.2.92). If the non-AP STA has user credentials that allow it to use a particular network, the non-AP STA can use its credentials to authenticate to the SSPN through the IEEE 802.11 infrastructure.

To use an emergency services association, a STA lacking security credentials can associate to a BSS in which emergency services are accessible by including an Interworking Element with the UESA field set to 1 in a (Re)Association Request frame. An AP receiving this type of (re)association request recognizes this as a request for unauthenticated emergency access. The AP can look up the VLAN ID to use with a AAA Server,

or it can have an emergency services VLAN configured. The STA can either have, policies configured locally for quality of service parameters and network access restrictions, or it can look them up through external policy servers.

When an emergency services association is used, the IEEE 802.11 infrastructure should be designed to restrict access to emergency call users. Methods of such restriction are beyond the scope of this standard, but can include an isolated VLAN for emergency services, filtering rules in the AP or network entity (e.g., router) in an external network to limit network access to only network elements involved in emergency calls, and per-session bandwidth control to place an upper limit on resource utilization.
